Agenda

https://www.wpninjas.be/
#wpninjasbe

- **Automation vs Agents vs Agentic AI**
- **Copilot in Intune**
  capabilities & limitations
- **Security Copilot agents in Intune**
  (public preview)
- **Building your own agents**
  Copilot Studio vs Security Copilot vs AI Foundry
- **Demos**

Key takeaways:

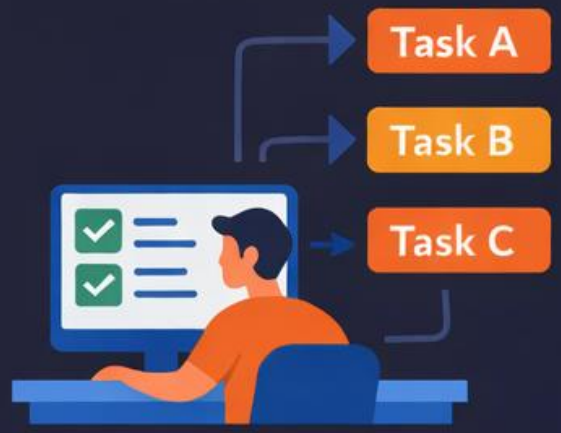

- AI can support you
- AI should be fun
- The right tools?
  -> those you love to work with

Automation vs Agents vs Agentic AI

Picking the right tool for the job

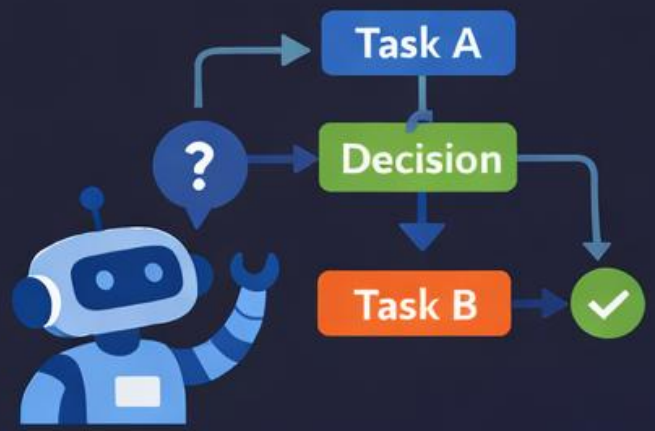

Automation

- Predefined Tasks
- Fixed Workflow

Human Guided

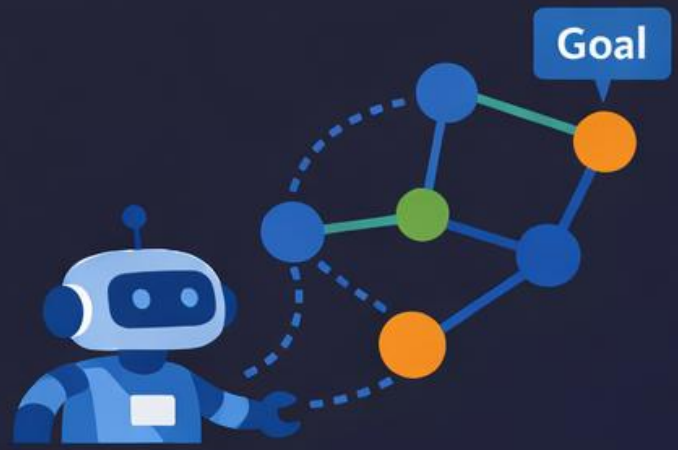

AI Agents

- Tasks & Reasoning
- Adaptive Decisions

AI Driven

Agentic AI

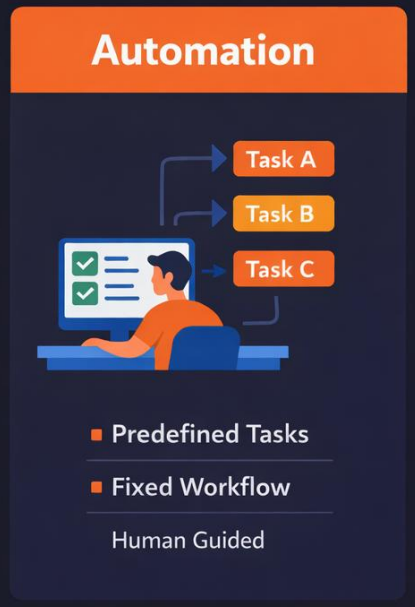

- Dynamic Planning
- Optimal Pathfinding

Self Directed

Automation

https://www.wpninjas.be/
#wpninjasbe

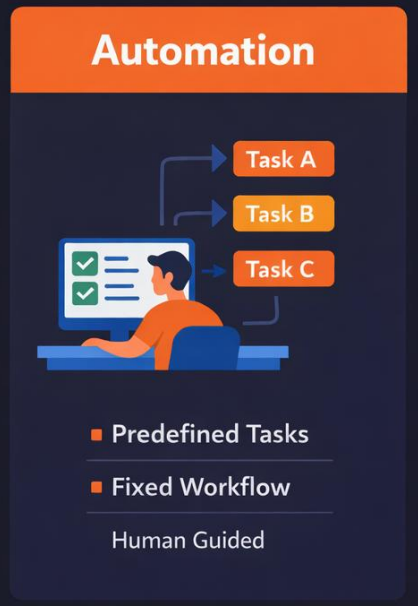

Definition: *Deterministic workflows that follow* ***predefined rules***
(e.g., PowerShell scripts, Intune remediation scripts, Logic Apps).

Characteristics:

- **Input:** structured / predictable
- **Logic:** if/then / no reasoning / no learning
- **Output:** repeatable / auditable / but brittle when context changes

Automation

https://www.wpninjas.be/
#wpninjasbe

Definition: *Deterministic workflows that follow* ***predefined rules***
(e.g., PowerShell scripts, Intune remediation scripts, Logic Apps).

Best Practices:

- **Scope clearly:** one narrow task per automation
- **Idempotence:** safe to run multiple times with existing resources
- **Guardrails:** RBAC / approvals for high-impact actions

Use cases:

- **Self-service:** auto-provision requested Cloud PC
- **Baseline tasks:** install apps / set registry keys / clean temp files
- **Compliance fixes:** auto-remediate missing BitLocker or AV

AI Agents

Definition: *Software entities that can **observe, reason & act** toward a goal (often using LLMs plus tools/APIs.)*

Characteristics:

- **Observe:** read signals (posture, alerts, policies)
- **Reason:** use LLMs to interpret context and choose actions
- **Act:** call Intune/Security APIs / create policies / open tickets

AI Agents

https://www.wpninjas.be/
#wpninjasbe

Definition: *Software entities that can **observe, reason & act** toward a goal (often using LLMs plus tools/APIs.)*

Best Practices:

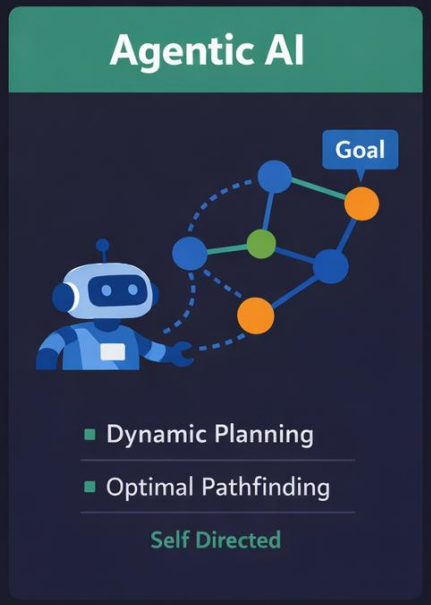

- **Human-in-the-loop:** require review for impactful changes
- **Least privilege:** narrow RBAC scopes per agent
- **Telemetry:** log decisions & actions for audit

Use cases:

- **Security posture:** draft policies to close gaps
- **Incident triage:** correlate alerts / propose remediation steps
- **Trend analyses:** are provisioned Cloud PCs right-sized/utilized?

Agentic AI

https://www.wpninjas.be/
#wpninjasbe

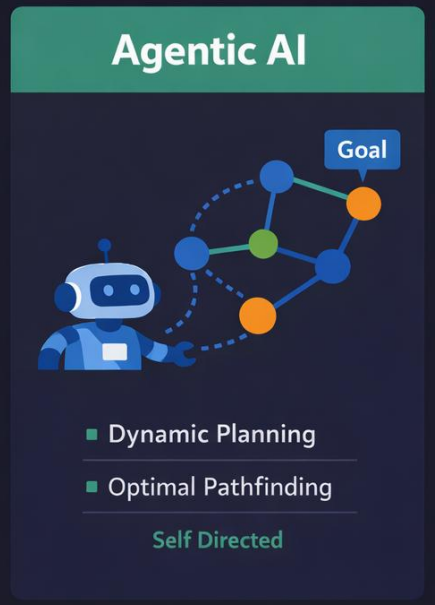

Definition: *Systems of one or more agents that can **plan, decompose tasks & coordinate** over time ("human-led, agent-operated" work)*

Characteristics:

- **Planning:** breakdown/simplify multi-step tasks
- **Persistence:** maintain config state across sessions/incidents
- **Tool orchestration:** dispatch tasks between multiple tools & agents

Agentic AI

https://www.wpninjas.be/
#wpninjasbe

Definition: *Systems of one or more agents that can **plan, decompose tasks & coordinate** over time ("human-led, agent-operated" work)*

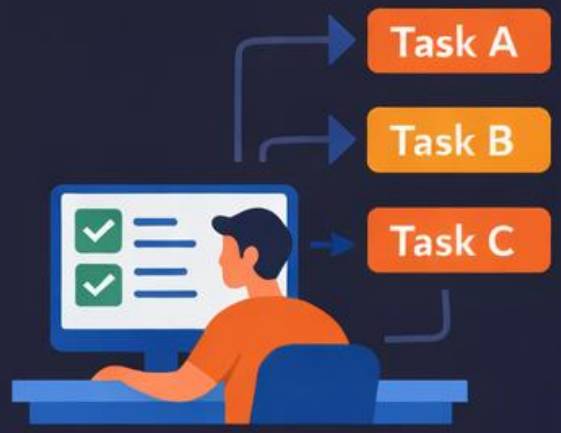

Best Practices:

- **Pilot first:** start with a small scope (one business unit)
- **Governance:** change management / approvals / rollback plans
- **Clear objectives:** define success metrics
  (e.g., "reduce non-compliant devices by 20%")

Use cases:

- **Continuous posture improvement loop:**
  detect gaps → propose policies → simulate impact → recommend rollout
- **End-to-end incident flow:** from detection to ticket closure with human checkpoints

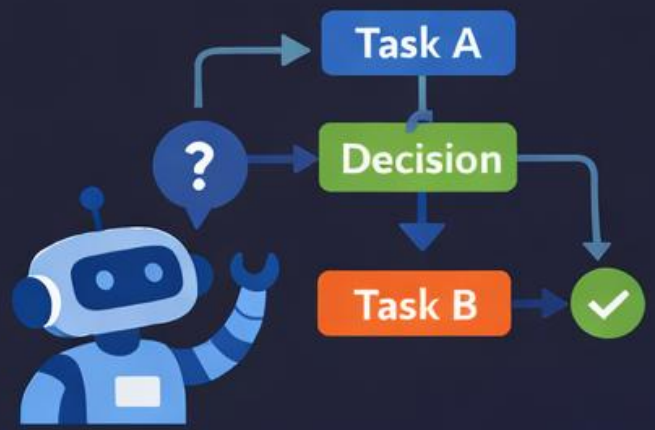

Automation

- Predefined Tasks
- Fixed Workflow

Human Guided

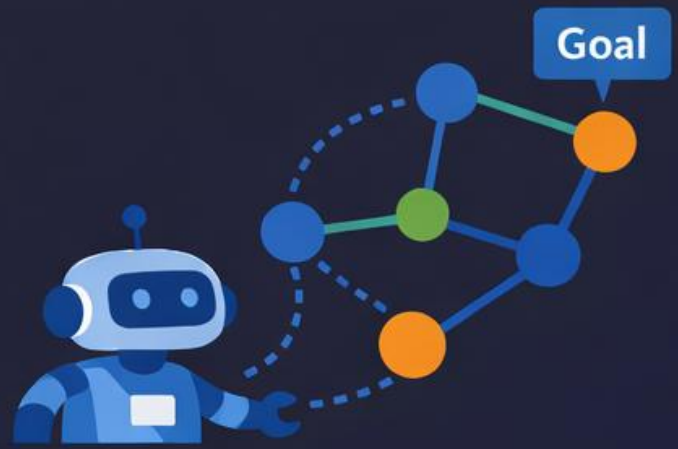

AI Agents

- Tasks & Reasoning
- Adaptive Decisions

AI Driven

Agentic AI

- Dynamic Planning
- Optimal Pathfinding

Self Directed

Copilot in Intune

capabilities & limitations

Copilot in Intune (aka Explorer)

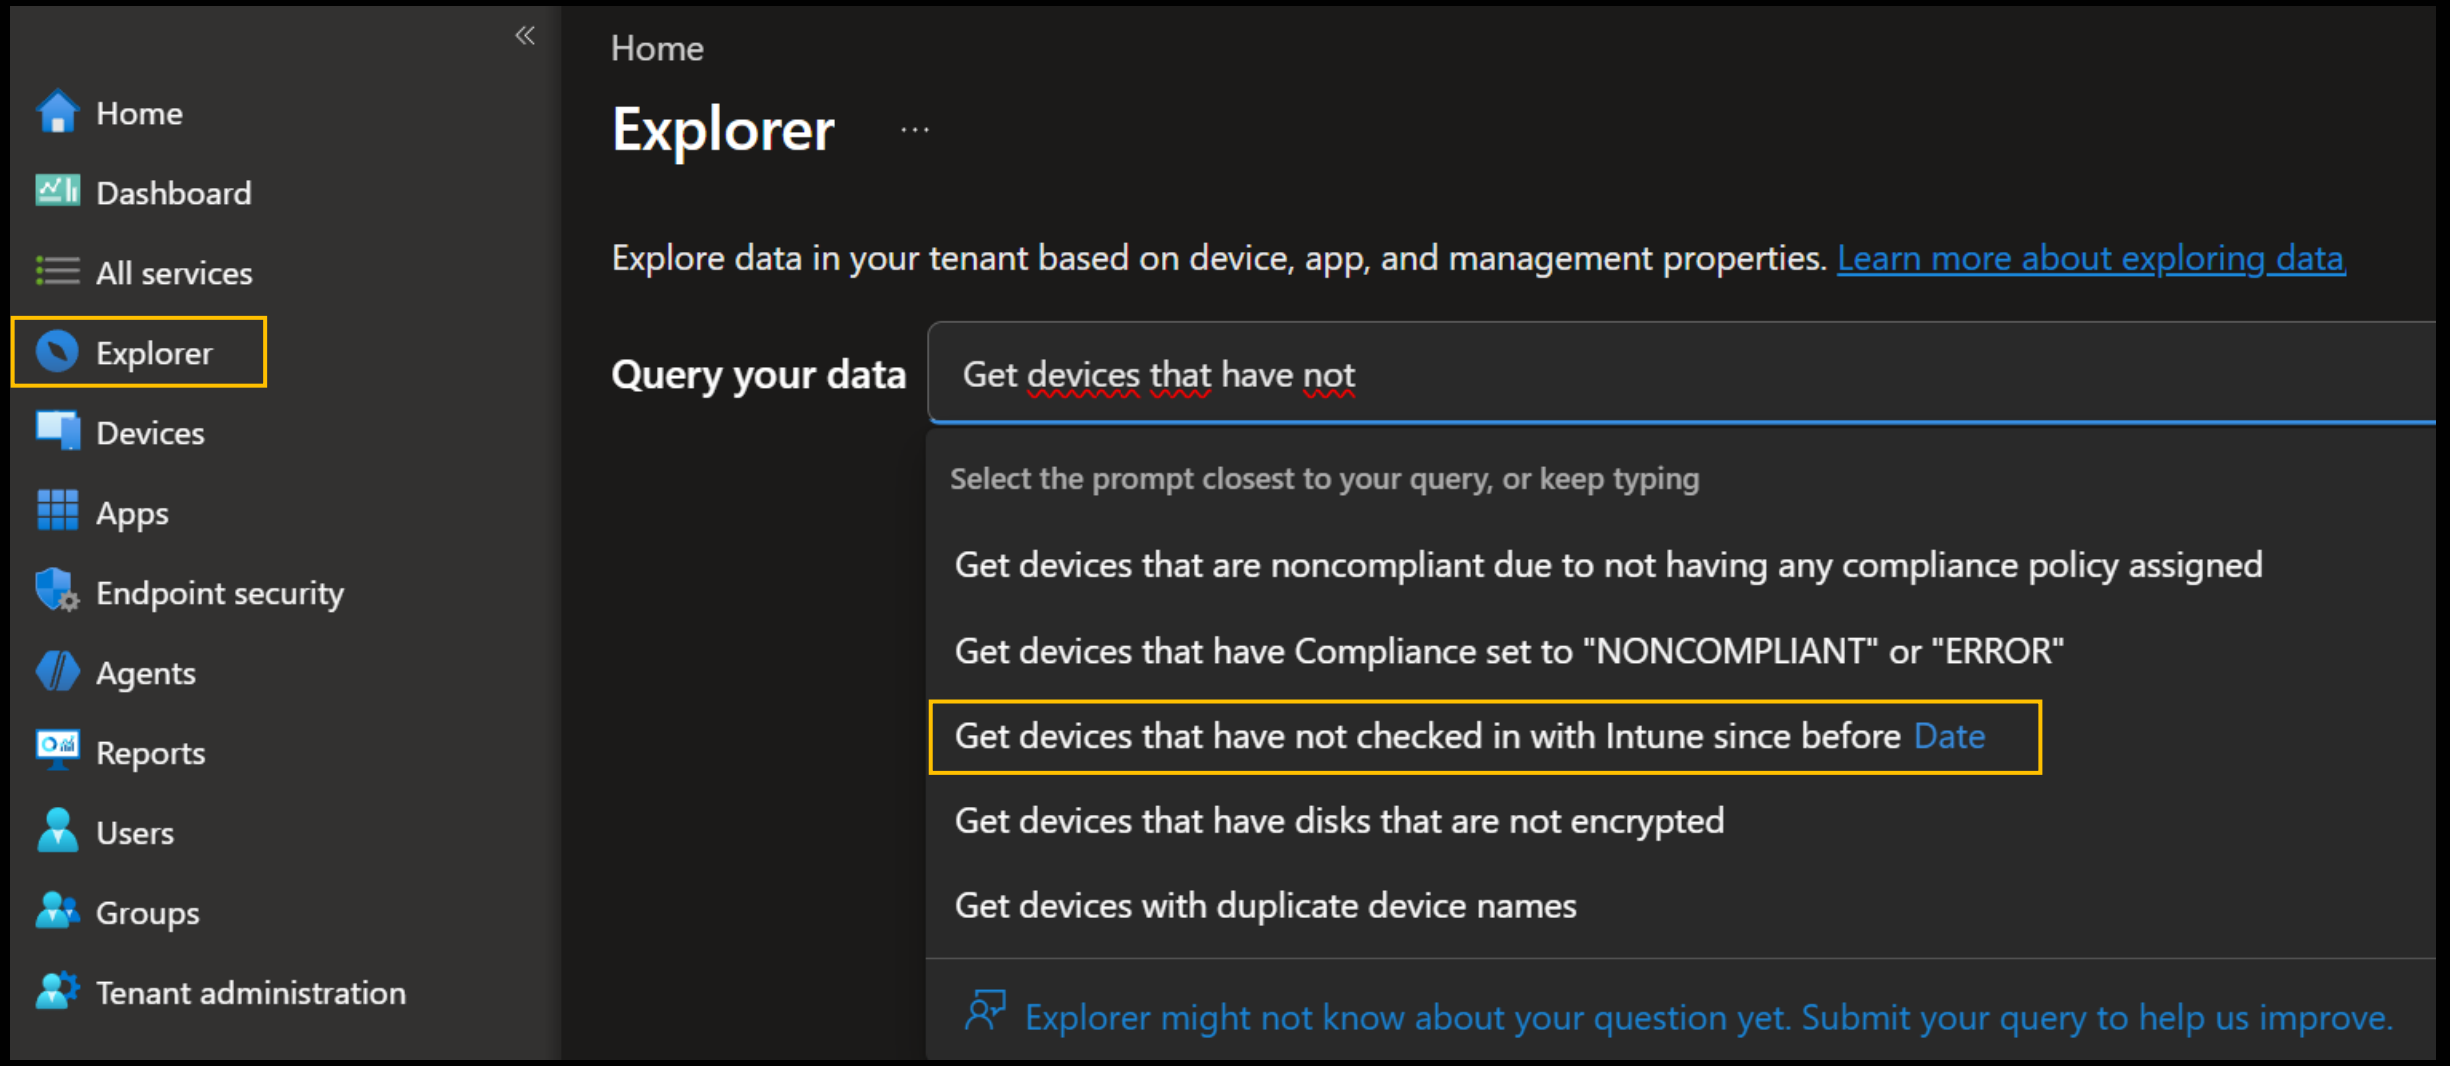

Definition: *Copilot experiences **embedded** in Intune to help admins query, understand & configure endpoint management using natural language.*

Key capabilities:

- **Explain:** *"explain why this device is non-compliant"*
- **Summarize:** summaries of policy sets / configuration drift / deployment issues
- **Draft:** propose policy configurations or remediation steps (admin-in-the-loop reviews & applies changes)

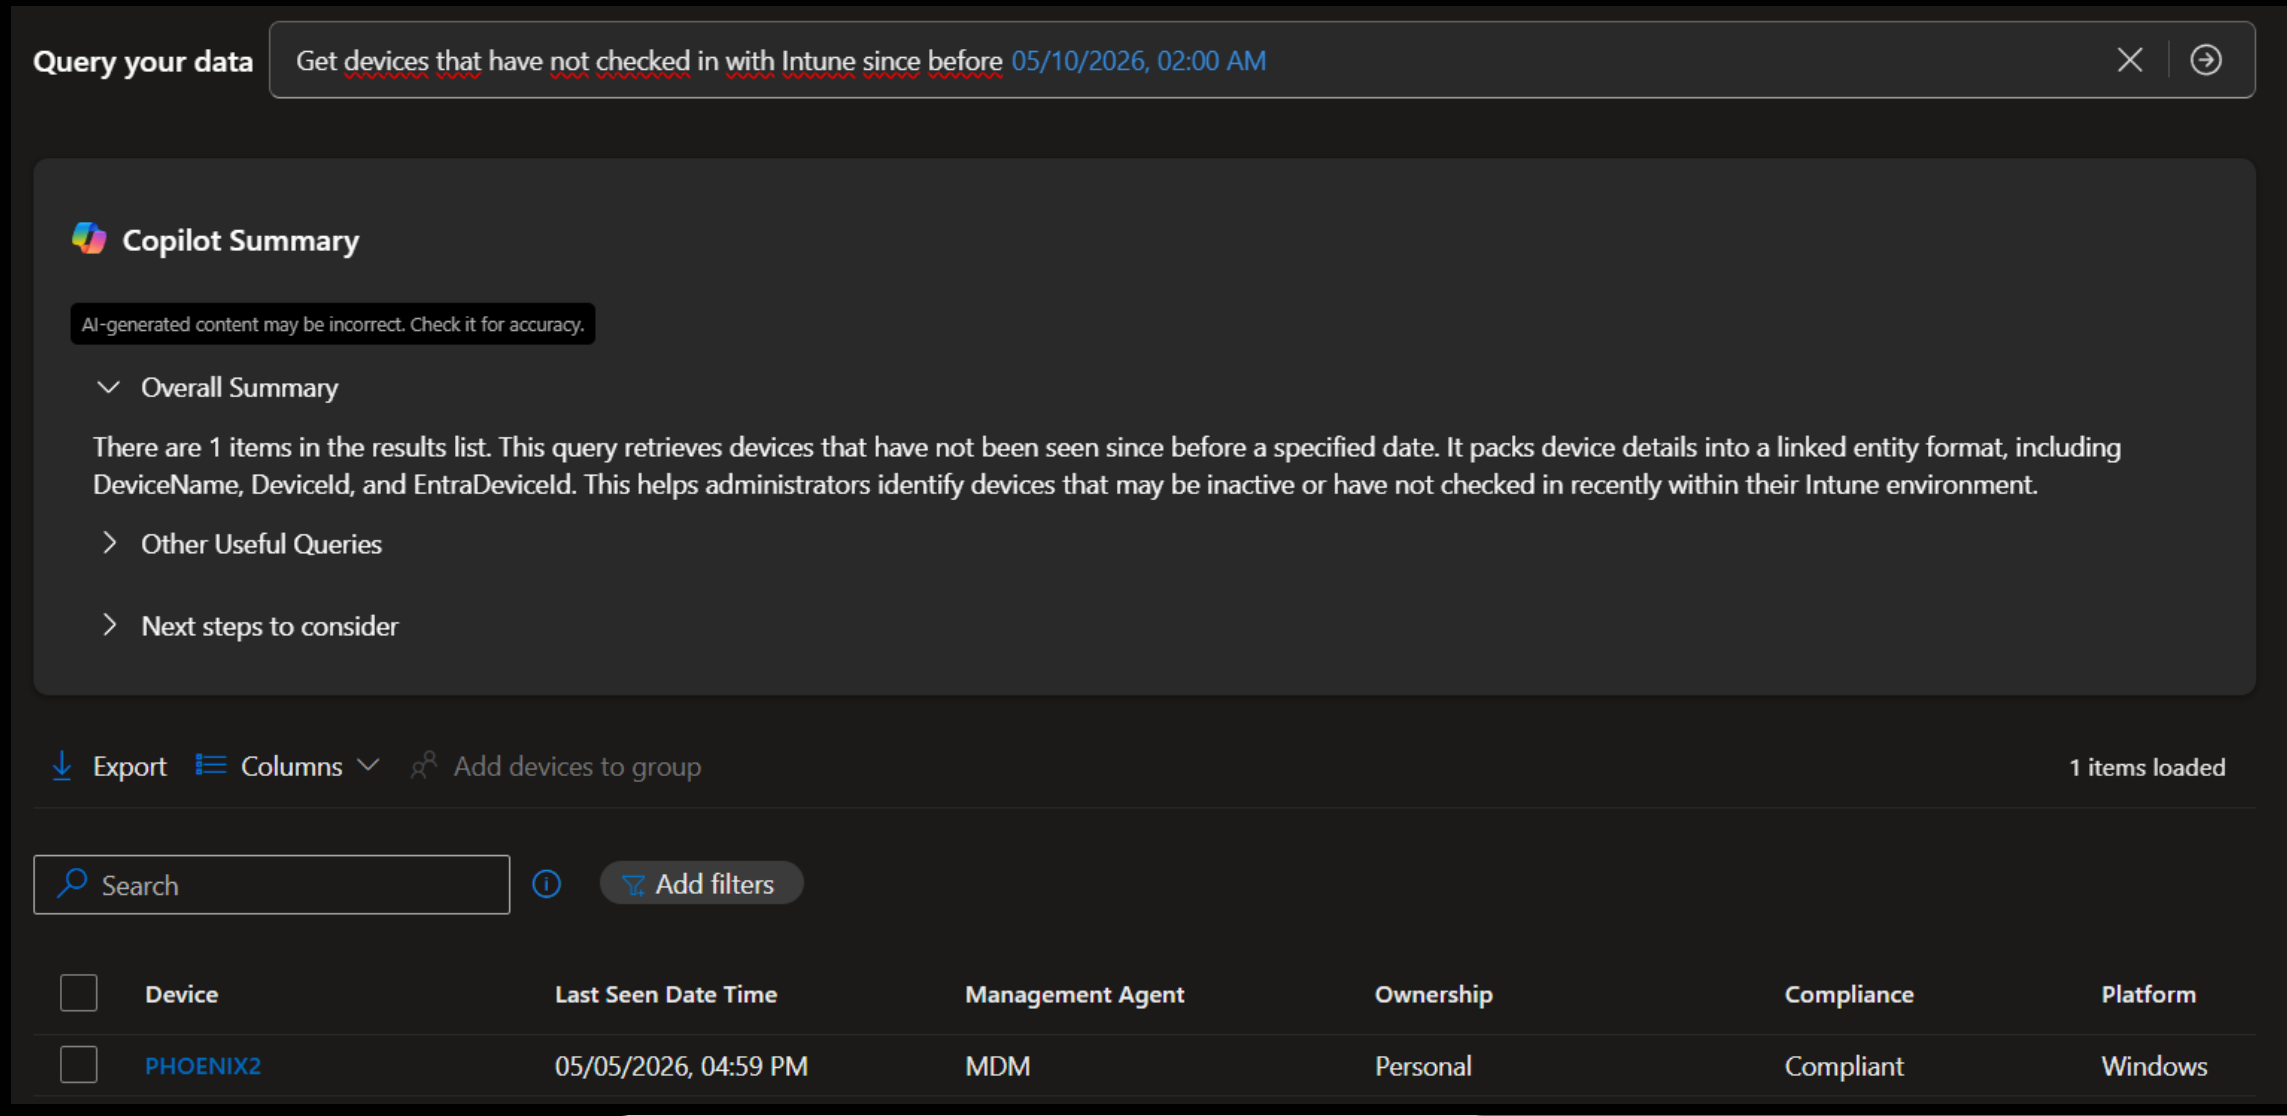

Explorer

https://www.wpninjas.be/
#wpninjasbe

Explorer

https://www.wpninjas.be/
#wpninjasbe

Explorer

https://www.wpninjas.be/
#wpninjasbe

Overall Summary

There are 1 items in the results list. This query retrieves devices that have not been seen since before a specified date. It packs device details into a linked entity format, including DeviceName, DeviceId, and EntraDeviceId. This helps administrators identify devices that may be inactive or have not checked in recently within their Intune environment.

Other Useful Queries

Query: Get Platform devices that are Ownership owned that have not checked in with Intune since before Date
Reason: This query provides a more detailed view by filtering for devices based on platform and ownership, helping you focus on specific device types that have not checked in.

Query: Get Platform devices that were enrolled before Date
Reason: This query helps you identify devices that were enrolled a long time ago, which may correlate with devices that are no longer active or managed.

Query: Get devices that have Compliance set to "NONCOMPLIANT" or "ERROR"
Reason: This query allows you to check if any of the inactive devices are also noncompliant or have errors, which can help prioritize remediation actions.

Next steps to consider

These suggestions were created by considering the next steps an IT admin managing an Intune environment might consider in the context of this query.

Review the list of devices that have not been seen since the specified date. This will help you identify potentially inactive or lost devices and take appropriate action, such as contacting users or initiating device retirement.

Cross-reference these devices with compliance status to determine if any pose a security risk due to noncompliance. Addressing noncompliant devices can improve your organization's security posture.

Consider running additional queries to filter by device platform, ownership, or enrollment date for more targeted insights. This can help you focus on specific device groups and streamline device management tasks.

Explorer (supporting admin tasks)

Typical workflows:

- **Troubleshooting:** analyze a device's compliance and suggest fixes
- **Policy design:** describe desired outcome / draft a policy or settings catalog configuration
- **Reporting:** natural language queries for *"devices at highest risk with missing critical patches"*

Benefits:

- **Speed:** faster root cause analysis
- **Discoverability:** surfaces relevant settings without deep portal hunting
- **Onboarding:** junior admins can leverage expert-like guidance

Explorer (limitations)

Action boundaries:

- **No autonomous changes (act):** admins must review/confirm changes
- **Scope:** works within supported Intune data and scenarios
  (not a general-purpose scripting engine)

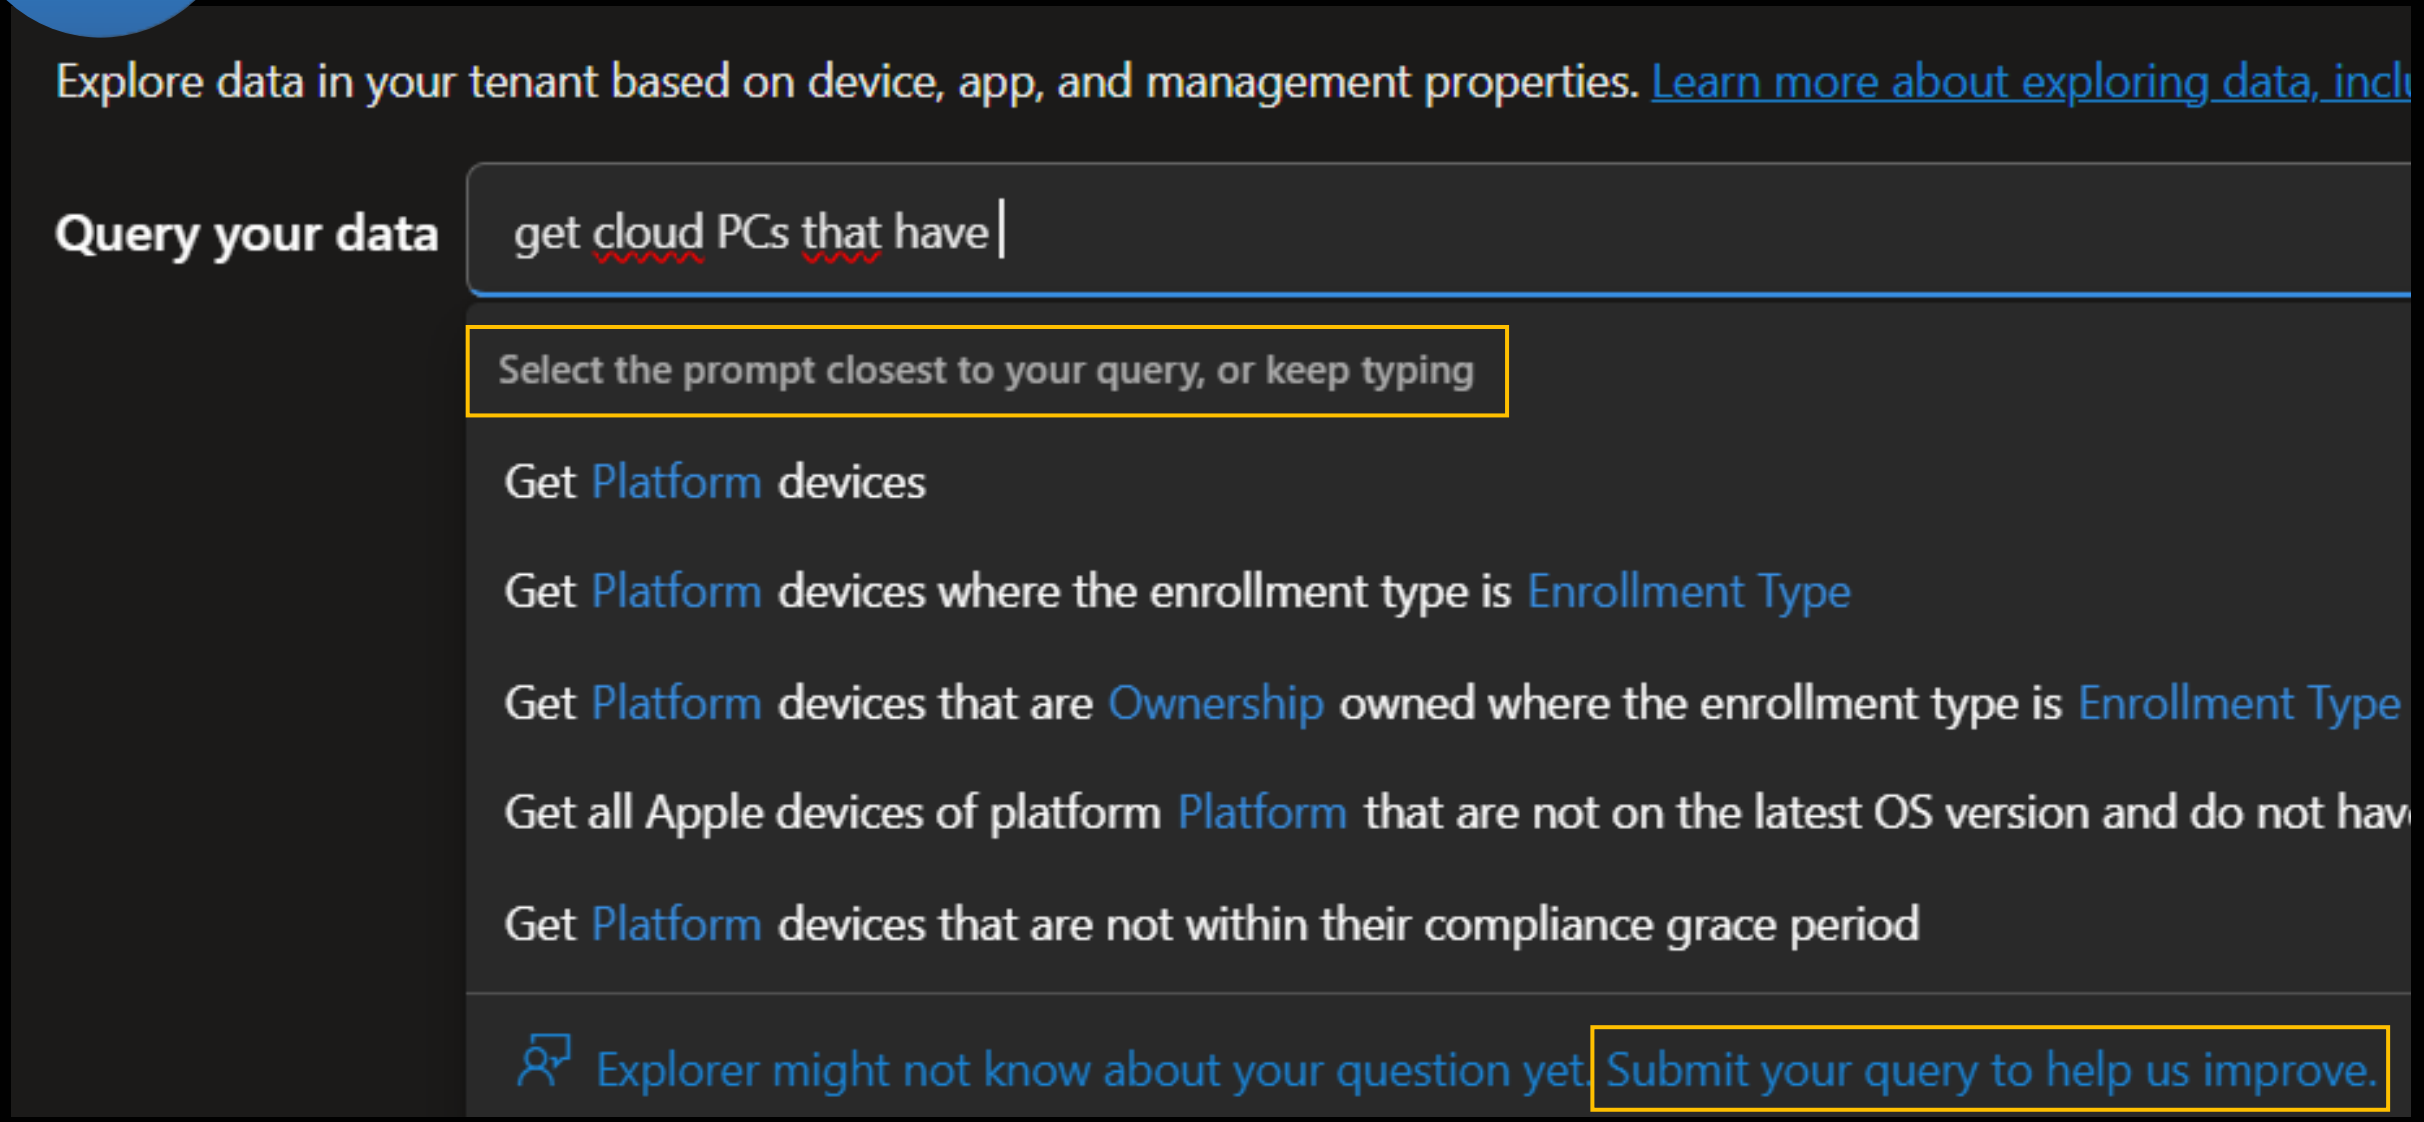

Data & context:

- **Latency & freshness:** some insights may lag behind real-time events
- **Tenant-bound:** only sees available Intune & connected services data

Governance:

- **Compliance:** must be aligned with your organization's data residency and AI usage policies.
- **RBAC:** Copilot respects admin permissions & limited visibility for lower-privilege roles.

Explorer

Security Copilot agents in Intune

** public preview **

Security Copilot agents

Definition: *AI-powered agents embedded in Intune that use **Security Copilot** to enhance endpoint security and posture management.*

Design:

- **Use-case specific:** each agent focuses on a scenario (e.g., vulnerability reduction, policy hygiene)
- **Observe–reason–act:** analyze signals / propose actions / automate with oversight
- **Integrated:** operate inside Intune admin center with RBAC and audit logs

Security Copilot agents

https://www.wpninjas.be/
#wpninjasbe

Change Review Agent

https://www.wpninjas.be/
#wpninjasbe

Goal: *Analyze recent Intune configuration changes and highlight potential risks or unintended impacts*

What it does:

- Reviews policy edits, assignments, and configuration updates
- Flags changes that may cause compliance drift or device impact
- Provides reasoning summaries and recommended follow-up actions

Ideal for: change management, troubleshooting unexpected behavior, validating admin actions.

Device Offboarding Agent

https://www.wpninjas.be/
#wpninjasbe

DEPRECATED

Goal: Streamline a ...vs.

What it does:

- Identifies device
- Checks for secur
- Suggests safe off

Ideal for: lifecycle
secure

ⓘ Important

Starting June 1, 2026, the Device Offboarding Agent will no longer be available.

Review your existing offboarding processes and transition to previously used device lifecycle and remediation options in Microsoft Intune before this date.

Device Offboarding Agent timeline

- **April 30, 2026**: You can't set up the Device Offboarding Agent.
- **June 1, 2026**: The Device Offboarding Agent is removed from the Intune admin center and isn't available.

What this change means for you

- You can continue using the Device Offboarding Agent until **June 1, 2026** if it's already set up.
- If you delete the agent between **April 30, 2026** and **June 1, 2026**, you can't set it up again.
- After **June 1, 2026**, the Device Offboarding Agent isn't accessible.

⚠ **Agent to be retired.** Device Offboarding Agent can't be deployed or redeployed to your tenant starting June 1, 2026. Learn more

source: https://learn.microsoft.com/en-us/intune/copilot/agents/manage-device-offboarding-agent?tabs=overview

Policy Configuration Agent

https://www.wpninjas.be/
#wpninjasbe

Goal: Recommend and refine Intune policy configurations to improve security posture and consistency.

What it does:

- Analyzes existing policies for gaps, misconfigurations, or redundancies
- Suggests optimized settings, aligned with best practices
- Helps draft/adjust policies with human approval

Ideal for: policy hygiene, posture improvement, reducing configuration drift

Agent is available

Agent finished running on 5/29/2026 at 4:46:18 PM.

About this agent

Import a document or write instructions in plain language. The agent will match those instructions to the Settings Catalog and help create a policy. Policy Configuration Agent currently supports policy for **Windows** devices only. Support for additional platforms will be introduced in future updates.
Learn more about this agent

Suggestion by Policy Configuration Agent
New | 5/29/2026, 5:23:23 PM

AI-generated content may be incorrect. Check it for accuracy.

AI Summary

Status: success

Problem:
The user requested an Intune Device Configuration policy based on a knowledge source containing a subset of CIS Benchmark recommendations for Windows 11, specifically referencing the v4.0.0 PDF.

Approach:
The system interpreted the request and used the provided knowledge source (ReferenceId: 73f501d9-a0a0-41e4-99aa-323e0abff19a) to extract relevant CIS Benchmark settings. These were matched against the Intune settings catalog for Windows 10/11, and a comprehensive policy was generated.

Result:

- **Settings Generated:** 9
- **Unmatched Requirements:** 0
- **Categories:** Sharing, Application Management, Notifications, Attachment Manager, Experience, Personalization

Next Steps:

- Review the generated policy in Intune for completeness and alignment with your organization's security requirements.
- Consider supplementing with additional CIS or organizational controls if needed.

Insights:
All extracted CIS Benchmark recommendations from the knowledge source were successfully mapped to Intune settings. This provides a strong baseline for CIS compliance on Windows 11 devices managed via Intune.

Policy Configuration Agent

https://www.wpninjas.be/
#wpninjasbe

Security Copilot agents

Best practices:

- **Pilot scope:** start with a subset of devices or test-group
- **Review workflows:** require human approval for high-impact actions (policy changes, device offboarding)
- **Feedback loop:** use agent recommendations as input to change advisory process

Security Copilot agents

Limitations:

- **Preview quality:** features, UI, and behavior may change
  (not all scenarios are covered)
- **Coverage:** agents focus on specific security/Intune scenarios
  (not full ITSM or SOC replacement)
- **Explainability:** reasoning is summarized
  (not every internal step is visible)

Building your own agents

Copilot Studio, Security Copilot & Azure AI Foundry

Agent builders

Copilot studio:

- business workflows / conversational copilots / process automation

Security Copilot Build:

- security operations / incident response / posture management

Microsoft Foundry (fka Azure AI Foundry)**:**

- custom agentic solutions with full control over models, tools & orchestration

Agent builders (comparison)

https://www.wpninjas.be/
#wpninjasbe

Platform	Complexity	Strength	Limitation
Copilot Studio	Low	Low-code workflows	Connector-bound
Security Copilot	Medium	Deep security data	Security-focused
Microsoft Foundry	High	Full control	Requires engineering

Agent builders

Copilot studio:

- **Use-cases:** helpdesk bots / business workflows
  Intune helpdesk assistant

Security Copilot:

- **Use-cases:** incident analysis / security posture agents
  Intune incident analyst persona

Microsoft Foundry:

- **Use-cases:** custom reasoning agents / multi-tool orchestration
  agent calling Graph to analyze non-compliant devices

Copilot Studio

Limitations:

- **Graph & API constraints:**
  - no full Graph access -> Custom Connectors
  - limited support for beta endpoints
- **Authentication:**
  - Entra ID app registration
- **Intune complexity:**
  - struggles with large & nested JSON responses
- **Automation gaps:**
  - no background jobs, scheduled tasks or remediation loops
- **Performance & debugging:**
  - Graph throttling, limited tracing & error visibility
- **Environment boundaries:**
  - single tenant only

Security Copilot Build

Limitations: (same as Copilot Studio)

+ Graph & API constraints
+ Authentication
+ Intune complexity (limited built-in skills)

Pros:

- **Skill architecture**
  - more advanced, modular skills & multi-step workflows
- **Reasoning for security context**
  - compliance analysis, benchmark mapping, identify drift
- **Flexible data processing**
  - larger JSON payloads, complex schema interpretation, multi-document comparisons
- **Correlating Intune data with Defender, Entra, etc.**

Here is the assessment of your recommendations against the "Generated PolicyAgent Policy" Intune policy:

AI-generated content may be incorrect. Check it for accuracy. Export to Excel

Recommendation	Policy Setting	Compliance Status
Turn on the Windows screensaver	Enable Screen Saver	Not Configured
Make the screensaver require authentication to unlock	Password protect the screen saver	Not Configured
Configure the screensaver to start after 15 minutes of inactivity	Screen saver timeout (User)	Configured (900 seconds)

Intune CIS Benchmark Agent

https://www.wpninjas.be/
#wpninjasbe

Here is the assessment of your recommendations against the "Generated PolicyAgent Policy" Intune policy:

AI-generated content may be incorrect. Check it for accuracy. Export to Excel

Recommendation	Policy Setting	Compliance Status	Conflict Detected	Risk Level	Reviewer Notes
Turn on the Windows screensaver	Enable Screen Saver	Not Configured	No	Medium	The policy does not explicitly enable the screensaver. No related setting found in this policy.
Make the screensaver require authentication to unlock	Password protect the screen saver	Not Configured	No	High	The policy does not enforce password protection on resume from screensaver.
Configure the screensaver to start after 15 minutes of inactivity	Screen saver timeout (User)	Configured (900 seconds)	No	Low	The policy sets the screensaver timeout to 15 minutes (900 seconds), matching the recommendation.

Intune CIS Benchmark Agent

https://www.wpninjas.be/
#wpninjasbe

Summary of Findings

- **Enable Screen Saver**: Not configured in this policy. The screensaver will not activate unless this is set elsewhere.
- **Password Protect the Screen Saver**: Not configured. This is a security risk, as users can bypass authentication after the screensaver starts.
- **Screen Saver Timeout**: Configured to 900 seconds (15 minutes), which is compliant with the recommendation.

No conflicts were detected with other policies, and the risk is highest for the lack of password protection on the screensaver.

Actionable Recommendation:

- Explicitly enable the screensaver and require password authentication on resume to fully comply with security best practices.
- The current configuration only sets the timeout, which is insufficient for full compliance and security.

Intune CIS Benchmark Agent

https://www.wpninjas.be/
#wpninjasbe

Summary of Findings

- **Enable Screen Saver**: Not configured in this policy. The screensaver will not activate unless this is set elsewhere.
- **Password Protect the Screen Saver**: Not configured. This is a security risk, as users can bypass authentication after the screensaver starts.
- **Screen Saver Timeout**: Configured to 900 seconds (15 minutes), which is compliant with the recommendation.

No conflicts were detected with other policies, and the risk is highest for the lack of password protection on the screensaver.

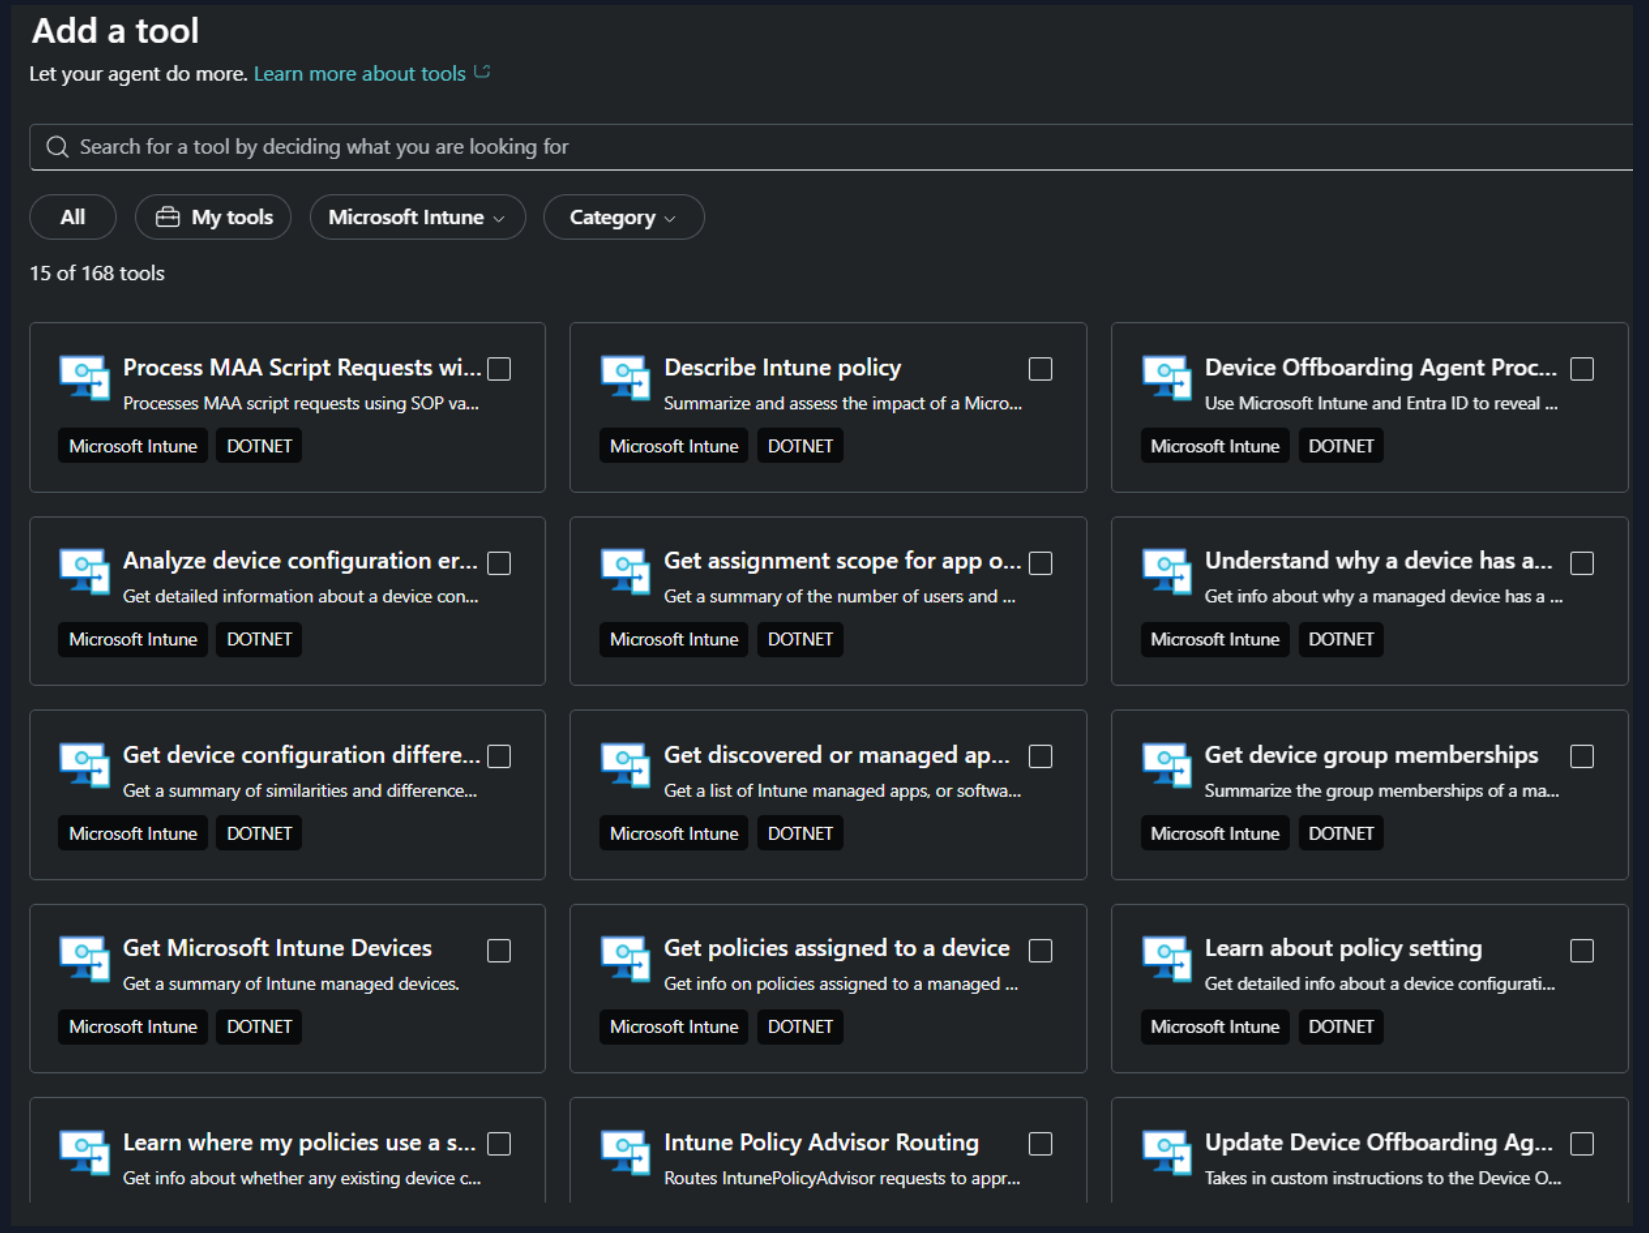

Actionable Recommendation:
