Agenda

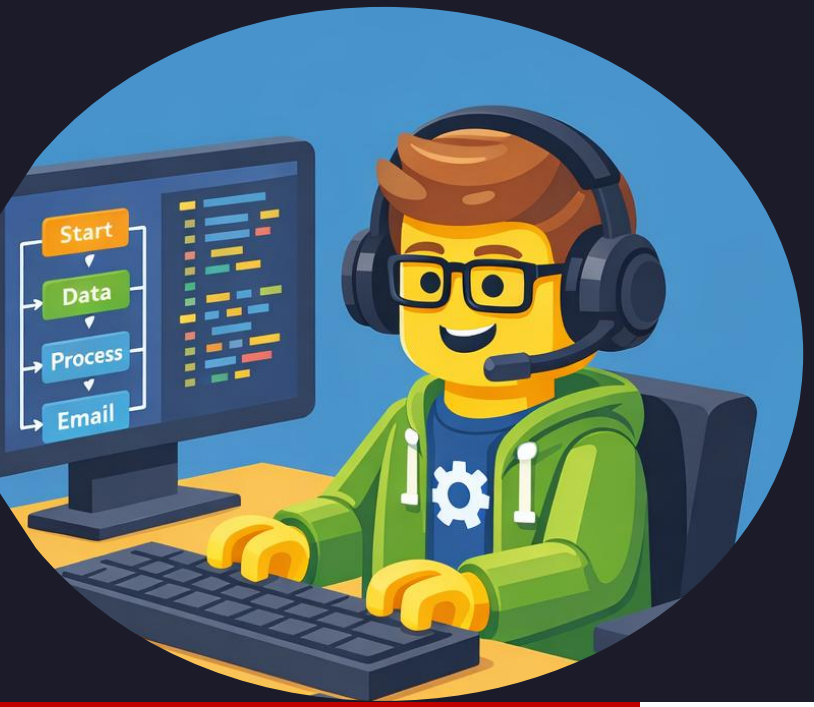

Key takeaways:

- AI can support you
- AI should be fun
- The right tools?
  -> those you love to work with

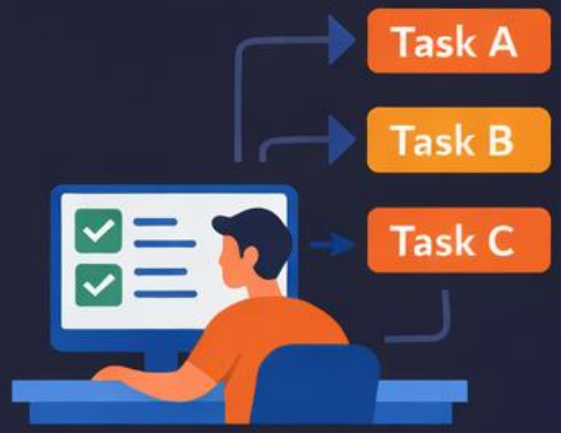

- **Automation vs Agents vs Agentic AI**
- **Copilot in Intune**
  capabilities & limitations
- **Security Copilot agents in Intune**
  (public preview)
- **Building your own agents**
  Copilot Studio vs Security Copilot vs AI Foundry
- **Demos**

Automation vs Agents vs Agentic AI

Picking the right technology for the job

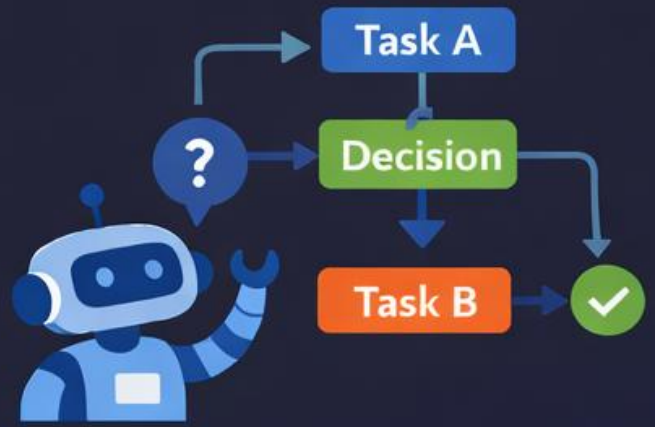

Automation

- Predefined Tasks
- Fixed Workflow

Human Guided

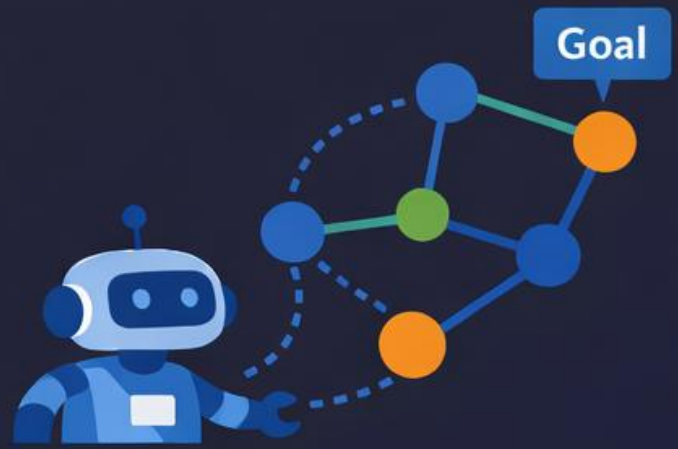

AI Agents

- Tasks & Reasoning
- Adaptive Decisions

AI Driven

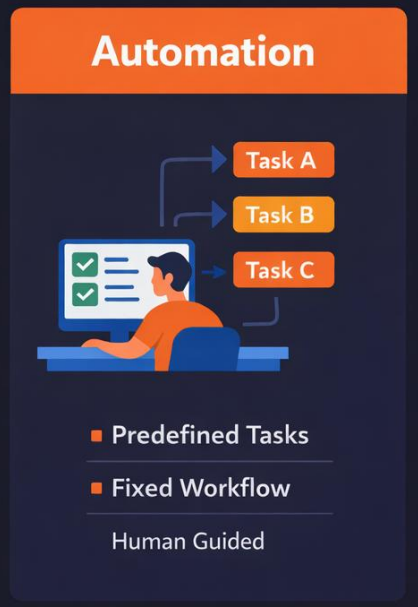

Agentic AI

- Dynamic Planning
- Optimal Pathfinding

Self Directed

Automation

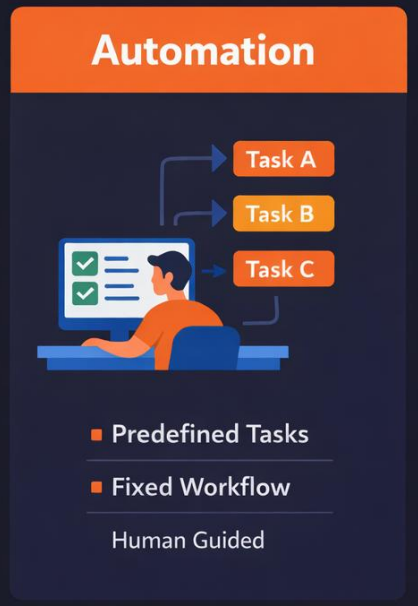

Definition: *Deterministic workflows that follow* ***predefined rules***
(e.g., PowerShell scripts, Intune remediation scripts, Logic Apps).

Characteristics:

- **Input:** structured, predictable.
- **Logic:** if/then, no reasoning, no learning.
- **Output:** repeatable, auditable, but brittle when context changes.

Automation

Definition: *Deterministic workflows that follow* ***predefined rules***
(e.g., PowerShell scripts, Intune remediation scripts, Logic Apps).

Best Practices:

- **Scope clearly:** one narrow task per automation.
- **Idempotence:** safe to run multiple times.
- **Guardrails:** RBAC, approvals for high-impact actions.

Use cases:

- **Compliance fixes:** auto-remediate missing BitLocker or AV.
- **Baseline tasks:** install agents, set registry keys, clean temp files.
- **Self-service:** auto-provision requested Cloud PC.

AI Agents

Definition: *Software entities that can **observe, reason & act** toward a goal (often using LLMs plus tools/APIs.)*

Characteristics:

- **Observe:** read signals (device posture, alerts, policies).
- **Reason:** use LLMs to interpret context and choose actions.
- **Act:** call Intune/Security APIs, create policies, open tickets.

AI Agents

Definition: *Software entities that can **observe, reason & act** toward a goal (often using LLMs plus tools/APIs.)*

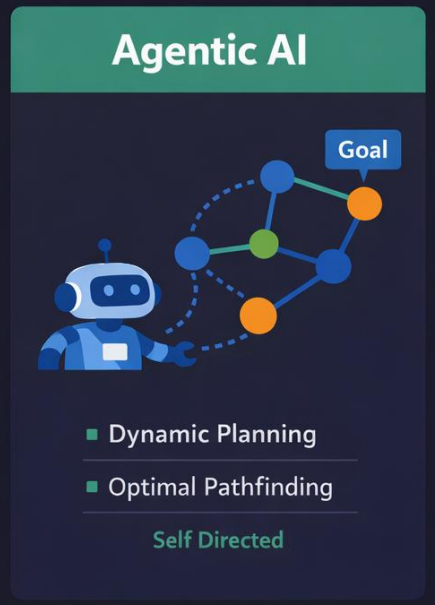

Best Practices:

- **Human-in-the-loop:** require review for impactful changes.
- **Least privilege:** narrow RBAC scopes per agent.
- **Telemetry:** log decisions and actions for audit.

Use cases:

- **Security posture agent:** suggest or draft policies to close gaps.
- **Incident triage agent:** correlate alerts, propose remediation steps.
- **Trend analyses:** are provisioned Cloud PCs used/right-sized?

Agentic AI

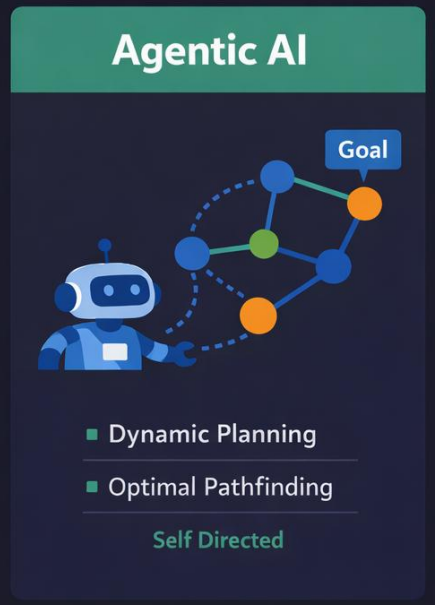

Definition: *Systems of one or more agents that can **plan, decompose tasks & coordinate** over time ("human-led, agent-operated" work)*

Characteristics:

- **Planning:** multi-step task decomposition.
- **Tool orchestration:** choose between multiple tools/agents.
- **Persistence:** maintain state across sessions/incidents.

Agentic AI

Definition: *Systems of one or more agents that can **plan, decompose tasks & coordinate** over time ("human-led, agent-operated" work)*

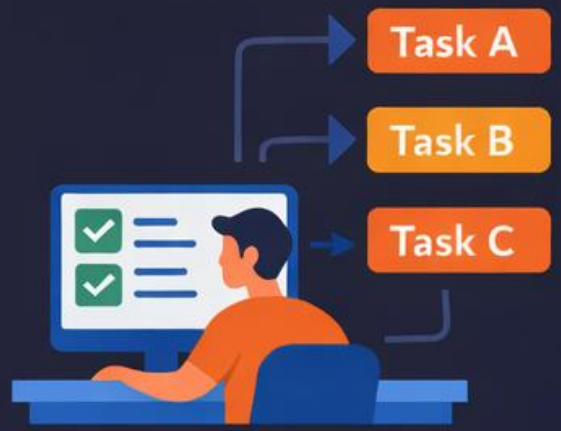

Best Practices:

- **Clear objectives:** define success metrics (e.g., "reduce non-compliant devices by 20%").
- **Governance:** change management, approvals, rollback plans.
- **Pilot first:** start with a small scope (one business unit).

Use cases:

- **Continuous posture improvement loop:** detect gaps → propose policies → simulate impact → recommend rollout.
- **End-to-end incident flow:** from detection to ticket closure with human checkpoints.

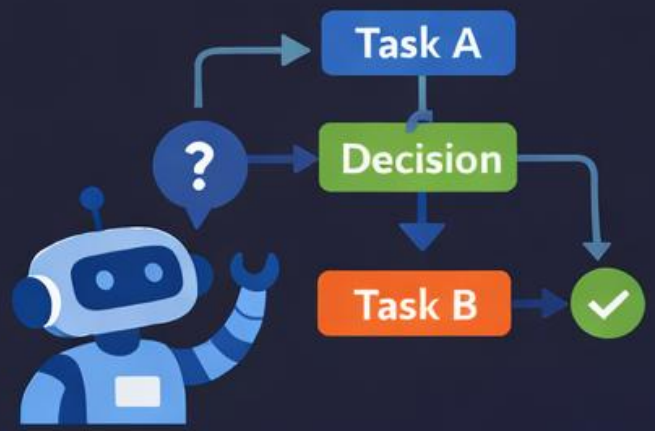

Automation

- Predefined Tasks
- Fixed Workflow

Human Guided

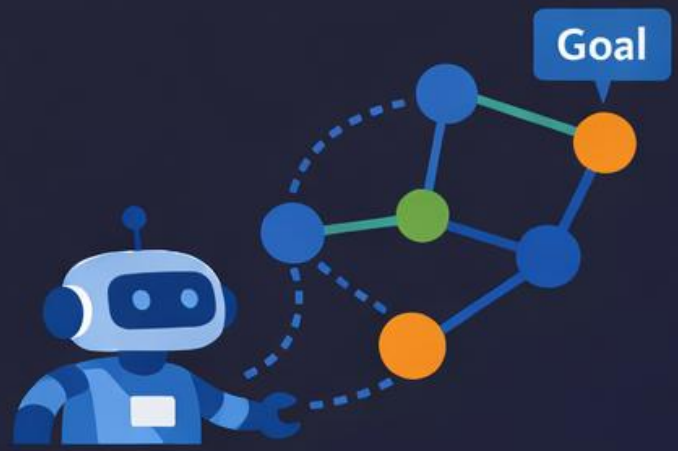

AI Agents

- Tasks & Reasoning

Copilot in Intune

capabilities & limitations

Copilot in Intune (aka Explorer)

Definition: *Copilot experiences **embedded** in Intune to help admins query, understand & configure endpoint management using natural language.*

Key capabilities:

- **Explain:** *"explain why this device is non-compliant."*
- **Summarize:** summaries of policy sets, configuration drift, or app deployment issues.
- **Draft:** propose policy configurations or remediation steps (admin reviews and applies).

Explorer

linkedin.com/company/euchtechdk
#EUCTech.DK

Query your data Get devices that have not checked in with Intune since before 02/15/2026, 02:00 AM

Copilot Summary

AI-generated content may be incorrect. Check it for accuracy.

Overall Summary

There are 1 items in the results list. This query retrieves devices that have not been seen since before a specified date. It packs device details into a linked entity format, including DeviceName, DeviceId, and EntraDeviceId. This helps administrators identify devices that may be inactive or have not checked in recently within their Intune environment.

Other Useful Queries

Copilot Summary

AI-generated content may be incorrect. Check it for accuracy.

Overall Summary

There are 1 items in the results list. This query retrieves devices that have not been seen since before a specified date. It packs device details into a linked entity format, including DeviceName, DeviceId, and EntraDeviceId. This helps administrators identify devices that may be inactive or have not checked in recently within their Intune environment.

Other Useful Queries

Query: Get Platform devices that are Ownership owned that have not checked in with Intune since before Date
Reason: This query provides a more detailed view by filtering for devices based on platform and ownership, helping you focus on specific device types that have not checked in.

Query: Get Platform devices that were enrolled before Date
Reason: This query helps you identify devices that were enrolled a long time ago, which may correlate with devices that are no longer active or managed.

Query: Get devices that have Compliance set to "NONCOMPLIANT" or "ERROR"
Reason: This query allows you to check if any of the inactive devices are also noncompliant or have errors, which can help prioritize remediation actions.

Next steps to consider

These suggestions were created by considering the next steps an IT admin managing an Intune environment might consider in the context of this query.

Review the list of devices that have not been seen since the specified date. This will help you identify potentially inactive or lost devices and take appropriate action, such as contacting users or initiating device retirement.

Cross-reference these devices with compliance status to determine if any pose a security risk due to noncompliance. Addressing noncompliant devices can improve your organization's security posture.

Consider running additional queries to filter by device platform, ownership, or enrollment date for more targeted insights. This can help you focus on specific device groups and streamline device management tasks.

Explorer

Next steps to consider

These suggestions were created by considering the next steps an IT admin managing an Intune environment might consider in the context of this query.

Explorer (supporting admin tasks)

Typical workflows:

- **Troubleshooting:** ask Copilot to analyze a device's compliance and suggest fixes.
- **Policy design:** describe desired outcome; Copilot drafts an Intune policy or settings catalog configuration.
- **Reporting:** natural language queries for *"devices at highest risk with missing critical patches"*

Benefits:

- **Speed:** faster root cause analysis.
- **Discoverability:** surfaces relevant settings without deep portal hunting.
- **Onboarding:** junior admins can leverage expert-like guidance.

Explorer (limitations)

Action boundaries:

- **No autonomous changes:** admins must review/confirm changes.
- **Scope:** works within supported Intune data and scenarios; not a general-purpose scripting engine.

Data & context:

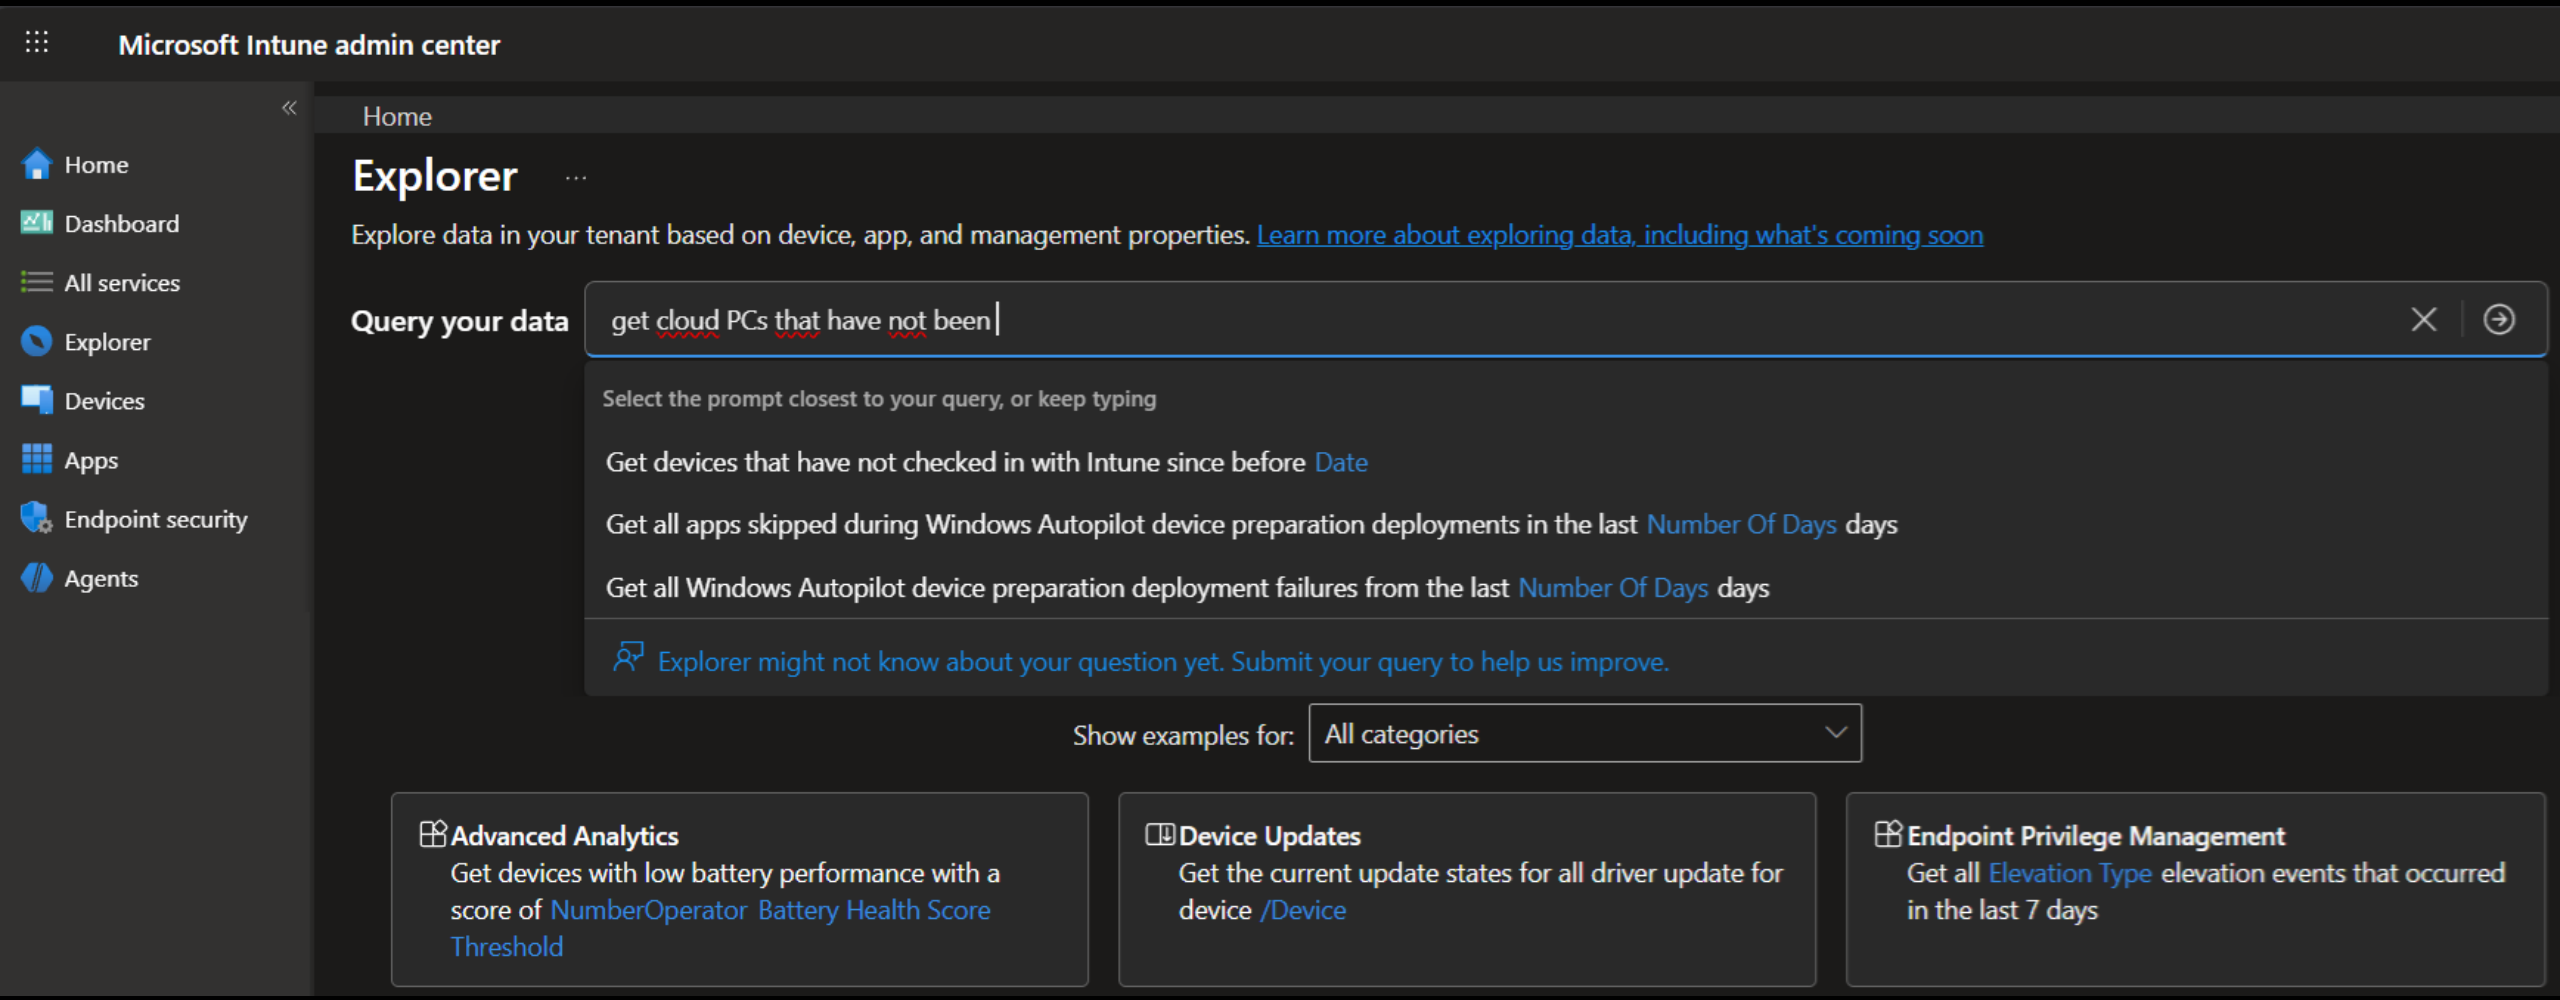

- **Tenant-bound:** only sees available Intune & connected services data.
- **Latency & freshness:** some insights may lag behind real-time events.

Governance:

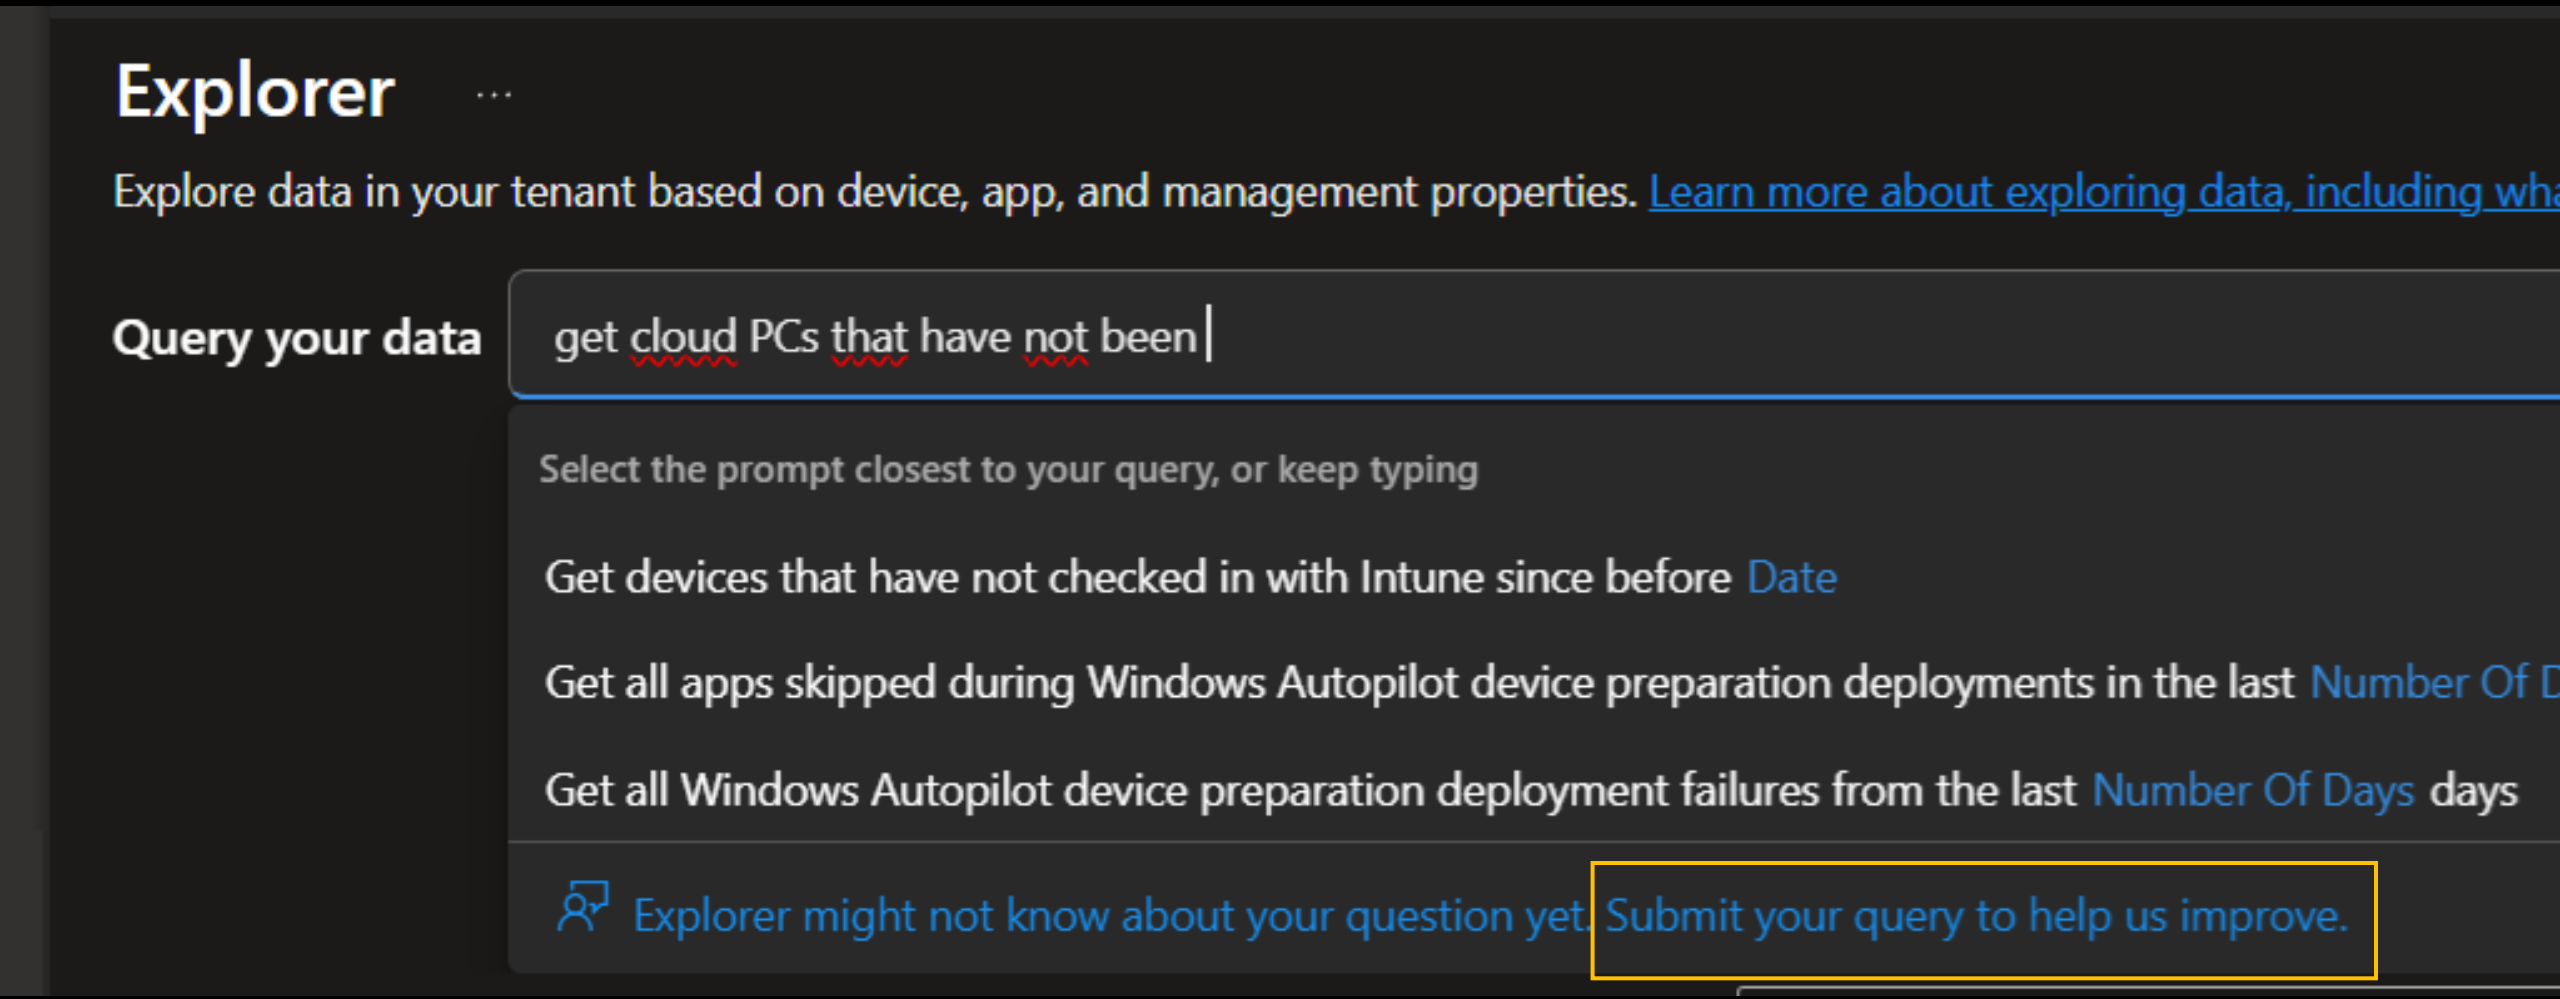

- **RBAC:** Copilot respects admin permissions & limited visibility for lower-privilege roles.
- **Compliance:** must be aligned with your organization's data residency and AI usage policies.

Security Copilot agents in Intune

** public preview **

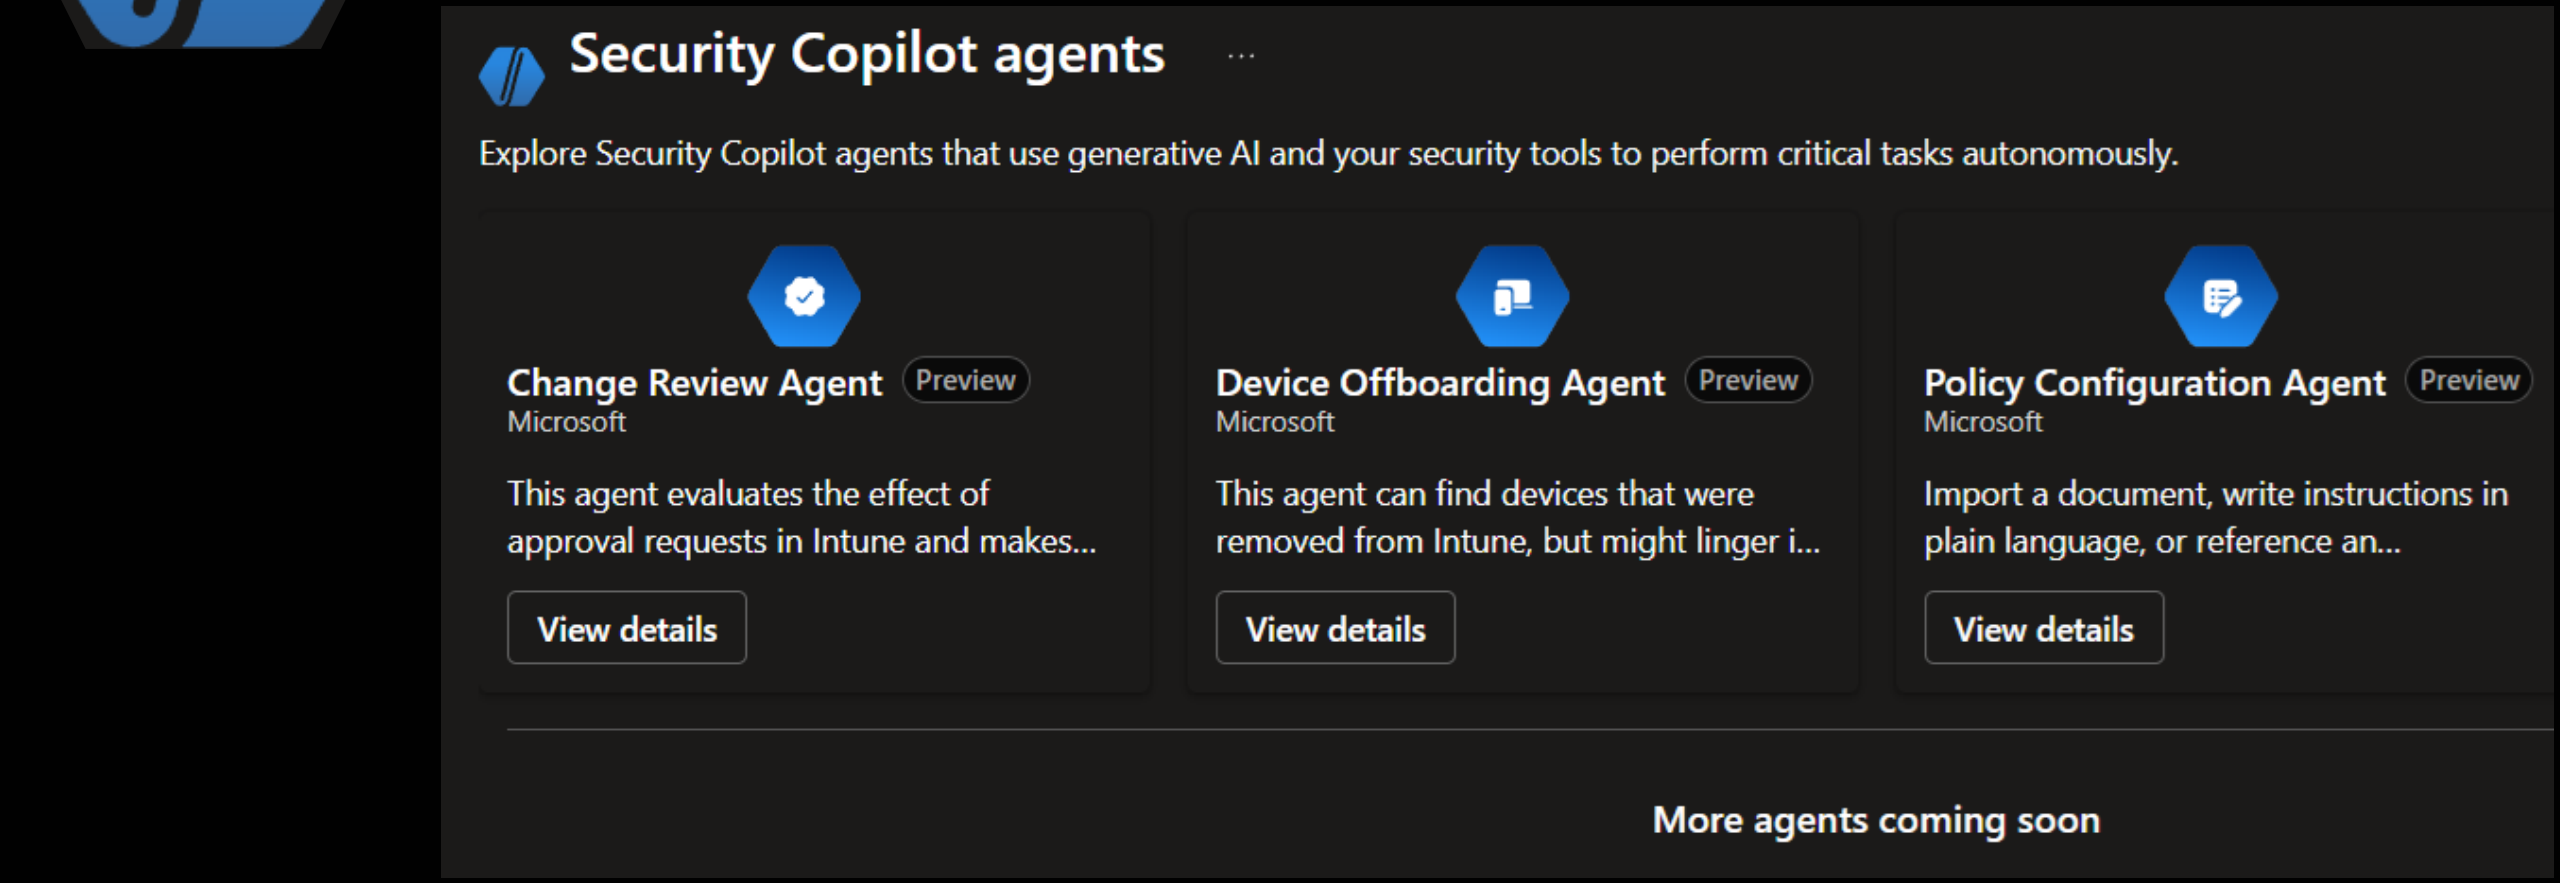

Security Copilot agents

Definition: *AI-powered agents embedded in Intune that use **Security Copilot** to enhance endpoint security and posture management.*

Design:

- **Use-case specific:** each agent focuses on a scenario (e.g., vulnerability reduction, policy hygiene).
- **Observe–reason–act:** analyze signals, propose actions, and can automate with oversight.
- **Integrated:** operate inside Intune admin center with RBAC and audit logs.

Security Copilot agents

Use the Device Offboarding Agent - Microsoft Intune | Microsoft Learn

Change Review Agent

Goal: *Analyze recent Intune configuration changes and highlight potential risks or unintended impacts.*

What it does:

- Reviews policy edits, assignments, and configuration updates.
- Flags changes that may cause compliance drift or device impact.
- Provides reasoning summaries and recommended follow-up actions.

Ideal for: change management, troubleshooting unexpected behavior, validating admin actions.

Device Offboarding Agent

DEPRECATED

Goal: Streamline a ys.

What it does:

- Identifies device
- Checks for secur
- Suggests safe off

Ideal for: lifecycle secure

> ⓘ Important
>
> **Starting June 1, 2026, the Device Offboarding Agent will no longer be available.**
>
> Review your existing offboarding processes and transition to previously used device lifecycle and remediation options in Microsoft Intune before this date.
>
> **Device Offboarding Agent timeline**
>
> - **April 30, 2026**: You can't set up the Device Offboarding Agent.
> - **June 1, 2026**: The Device Offboarding Agent is removed from the Intune admin center and isn't available.
>
> **What this change means for you**
>
> - You can continue using the Device Offboarding Agent until **June 1, 2026** if it's already set up.
> - If you delete the agent between **April 30, 2026** and **June 1, 2026**, you can't set it up again.
> - After **June 1, 2026**, the Device Offboarding Agent isn't accessible.

source: https://learn.microsoft.com/en-us/intune/copilot/agents/manage-device-offboarding-agent?tabs=overview

Policy Configuration Agent

Goal: Recommend and refine Intune policy configurations to improve security posture and consistency.

What it does:

- Analyzes existing policies for gaps, misconfigurations, or redundancies.
- Suggests optimized settings aligned with best practices.
- Helps draft or adjust policies with human approval.

Ideal for: policy hygiene, posture improvement, reducing configuration drift.

Demo

Policy Configuration Agent

Import a document or write instructions in plain language. The agent will match those instructions to the Settings Catalog and help build the right policy. Learn more about this agent

Required permissions

To use the agent to make new policies, you will need:

✓ Read Intune device configuration profiles (Microsoft.Intune/Device configurations/Read)

Identity

The agent will run using the identity of the user shown below and you can change the identity at any time. Ensure the user who the agent identity is running under has the appropriate role-based access permission or the agent will fail to run. If agent is unused for 90 days, authentication will expire and need to be renewed. Learn more about agent authentication

Plugins

These plugins are required for the agent to run. If they aren't already turned on, they will be automatically turned on only for this agent's use. Learn more about plugins

Microsoft Intune

Roles with access

Anyone with the required permissions, which can include a custom role or a Security Reader role. Learn more about RBAC roles

Agent is available

About this agent

Import a document or write instructions in plain language. The agent will match those instructions to the Settings Catalog and help create a policy. Policy Configuration Agent currently supports policy for **Windows** devices only. Support for additional platforms will be introduced in future updates.
Learn more about this agent

Agent suggestions AI-generated content may be incorrect. Check it for accuracy.

Based on the information you provided, the agent suggests the new policies listed here. Select a policy or knowledge source to review its details. You can then make edits if needed, and then go on to deploy the policy or save the knowledge source when you're ready.

Suggested next steps	Suggestion type	Status	Last updated ↓

Security Copilot agents

Best practices:

- **Pilot scope:** start with a subset of devices or a test group.
- **Review workflows:** require human approval for high-impact actions (e.g., broad policy changes).
- **Feedback loop:** use agent recommendations as input to change advisory process.

Security Copilot agents

Limitations:

- **Preview quality:** features, UI, and behavior may change; not all scenarios are covered.
- **Coverage:** agents focus on specific security/Intune scenarios, not full ITSM or SOC replacement.
- **Explainability:** reasoning is summarized, but not every internal step is visible.

Security Copilot agents

Create new knowledge source

Upload document

Only .txt files up to 25 KB are supported. Uploading in this format allows the agent to access its content and provide specific answers. Uploaded docs will automatically be assessed for their impact on the agent.

Drag and drop the files or Browse for files

Building your own agents

Copilot Studio, Security Copilot & Azure AI Foundry

Agent builders

Copilot studio:

- **Focus:** business workflows, conversational copilots, and process automation.
- **Strength:** low-code, connectors, Power Platform integration.

Security Copilot:

- **Focus:** security operations, incident response, posture management.
- **Strength:** deep integration with Defender, Entra, Intune, Purview.

Microsoft Foundry (fka Azure AI Foundry):

- **Focus:** custom agentic solutions w/ full control over models, tools & orchestration.
- **Strength:** maximum flexibility, but more engineering effort.

Agent builders (comparison)

Platform	Complexity	Strength	Limitation
Copilot Studio	Low	Low-code workflows	Connector-bound
Security Copilot	Medium	Deep security data	Security-focused
Microsoft Foundry	High	Full control	Requires engineering

Agent builders

Copilot studio:

- **When to use:** helpdesk bots, business workflows.
- **Scenario:** *Intune helpdesk assistant*

Security Copilot:

- **When to use:** incident analysis, security posture agents.
- **Scenario:** *Intune incident analyst persona*

Microsoft Foundry:

- **When to use:** custom reasoning agents, multi-tool orchestration
- **Scenario:** *custom agent calling Graph to analyze non-compliant devices*

Copilot Studio

Limitations:

- **Graph & API constraints:**
  - no full Graph access -> Custom Connectors
  - limited support for beta endpoints
- **Authentication:**
  - Entra ID app registration
- **Intune complexity:**
  - struggles with large & nested JSON responses
- **Automation gaps:**
  - no background jobs, scheduled tasks or remediation loops
- **Performance & debugging:**
  - Graph throttling, limited tracing & error visibility
- **Environment boundaries:**
  - single tenant only

Security Copilot Build

Limitations: (same as Copilot Studio)

+ Graph & API constraints
+ Authentication
+ Intune complexity (limited built-in skills)

Pros:

- **Skill Architecture**
  - more advanced, modular skills & multi-step workflows
- **Reasoning for security context**
  - compliance analysis, benchmark mapping, identify drift
- **Flexible data processing**
  - larger JSON payloads, complex schema interpretation, multi-document comparisons
- **Correlating Intune data with Defender, Entra, etc.**

Demo

Here is the assessment of your recommendations against the "Generated PolicyAgent Policy" Intune policy:

AI-generated content may be incorrect. Check it for accuracy. Export to Excel

Recommendation	Policy Setting	Compliance Status
Turn on the Windows screensaver	Enable Screen Saver	Not Configured
Make the screensaver require authentication to unlock	Password protect the screen saver	Not Configured
Configure the screensaver to start after 15 minutes of inactivity	Screen saver timeout (User)	Configured (900 seconds)

Demo

Here is the assessment of your recommendations against the "Generated PolicyAgent Policy" Intune policy:

AI-generated content may be incorrect. Check it for accuracy. Export to Excel

Recommendation	Policy Setting	Compliance Status	Conflict Detected	Risk Level	Reviewer Notes
Turn on the Windows screensaver	Enable Screen Saver	Not Configured	No	Medium	The policy does not explicitly enable the screensaver. No related setting found in this policy.
Make the screensaver require authentication to unlock	Password protect the screen saver	Not Configured	No	High	The policy does not enforce password protection on resume from screensaver.
Configure the screensaver to start after 15 minutes of inactivity	Screen saver timeout (User)	Configured (900 seconds)	No	Low	The policy sets the screensaver timeout to 15 minutes (900 seconds), matching the recommendation.

Demo

Summary of Findings

- **Enable Screen Saver**: Not configured in this policy. The screensaver will not activate unless this is set elsewhere.
- **Password Protect the Screen Saver**: Not configured. This is a security risk, as users can bypass authentication after the screensaver starts.
- **Screen Saver Timeout**: Configured to 900 seconds (15 minutes), which is compliant with the recommendation.

No conflicts were detected with other policies, and the risk is highest for the lack of password protection on the screensaver.

Actionable Recommendation:

- Explicitly enable the screensaver and require password authentication on resume to fully comply with security best practices.
- The current configuration only sets the timeout, which is insufficient for full compliance and security.

Demo

Summary of Findings

- **Enable Screen Saver**: Not configured in this policy. The screensaver will not activate unless this is set elsewhere.
- **Password Protect the Screen Saver**: Not configured. This is a security risk, as users can bypass authentication after the screensaver starts.
- **Screen Saver Timeout**: Configured to 900 seconds (15 minutes), which is compliant with the recommendation.

No conflicts were detected with other policies, and the risk is highest for the lack of password protection on the screensaver.

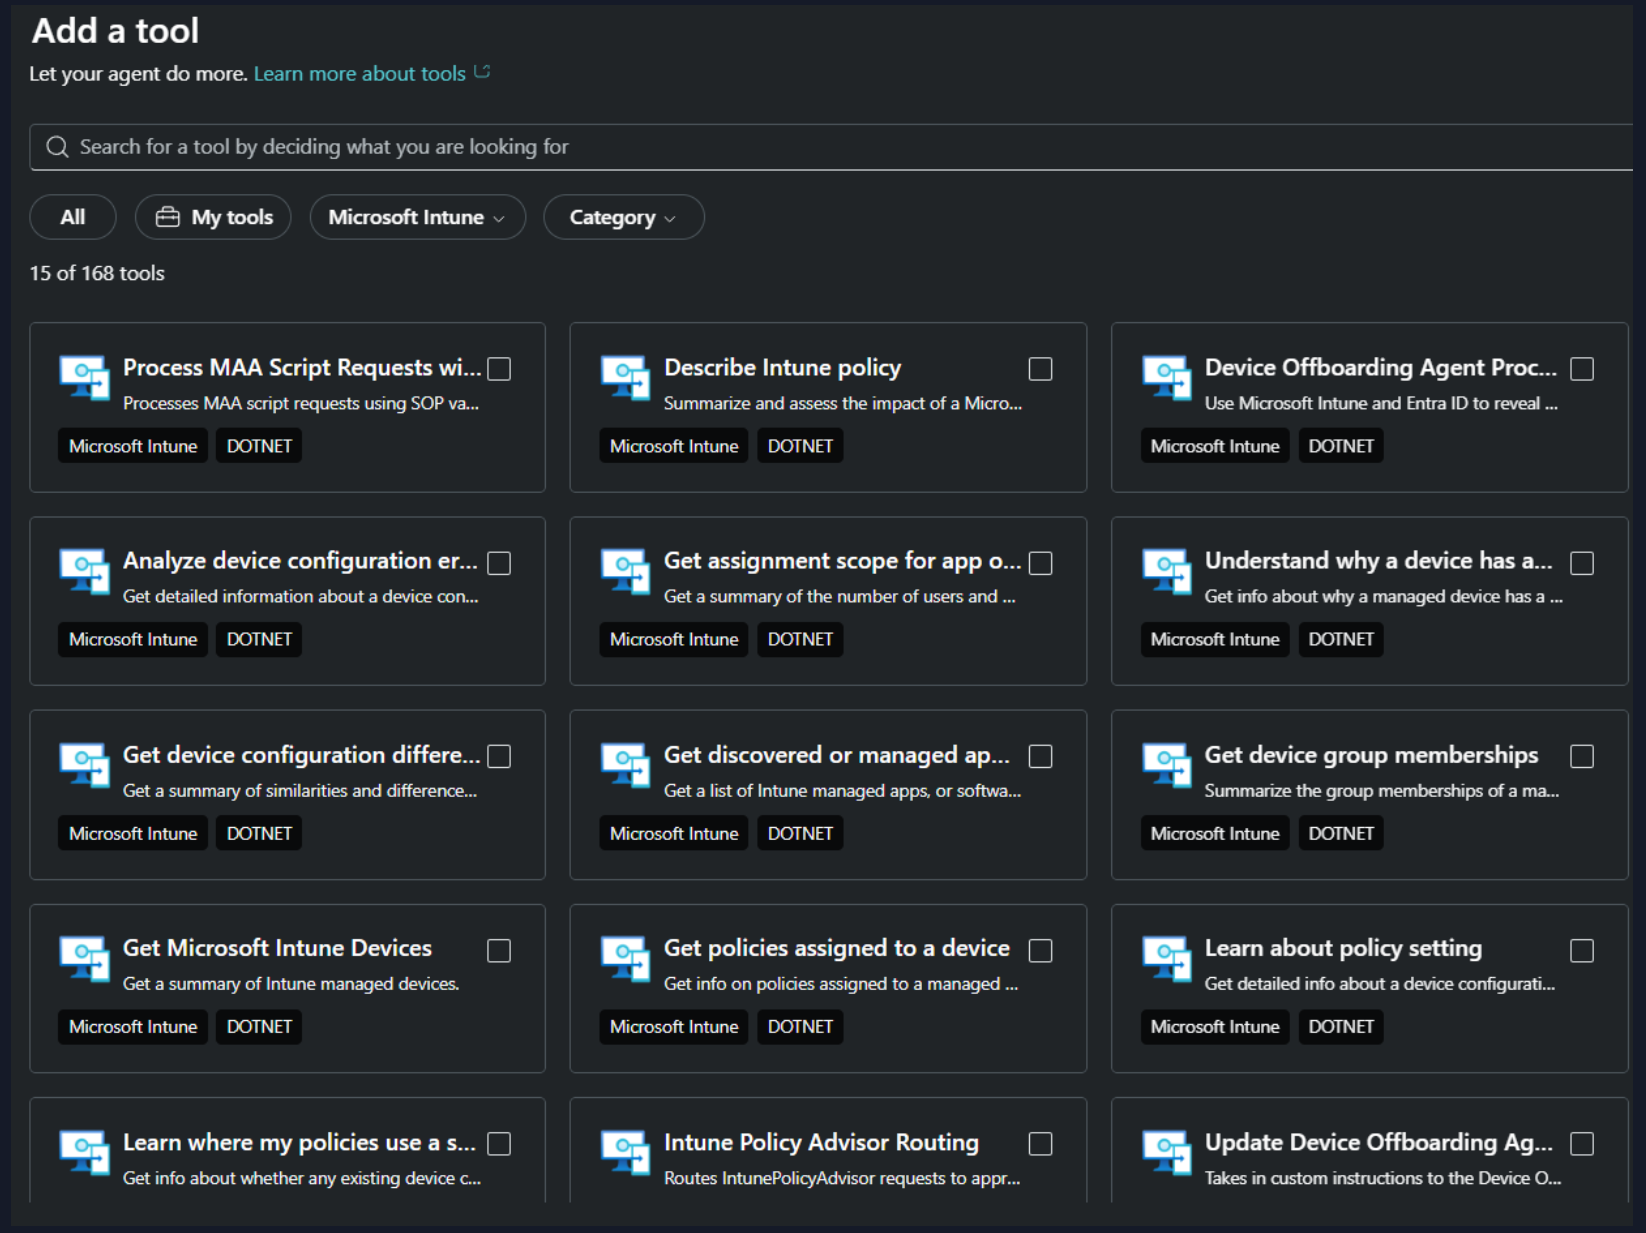

Actionable Recommendation:

- Explicitly enable the screensaver and require password authentication on resume to fully comply with security best practices.
- The current configuration only sets the timeout, which is insufficient for full compliance and security.
